CHAPTER I

INTRODUCTION

1.1 Project Context

Electronic Data Processing (EDP) services are crucial for an organization. They are the primary hub for surveillance, coordination, and control of digital information. They are critical to ensure the quality and efficiency of information management. They facilitate timely access to information and provide ongoing support for administrative and educational processes. These instruments allow employees, students, and other stakeholders to seek help in creating, accessing, or manipulating the data they need to accomplish their work. But as the number of requests has grown, so has the workload on the EDP staff. They struggle to monitor, authenticate, and fulfill requests from users with diverse needs. All these are usually done manually, using paper forms, making the work monotonous, time-wasting, and prone to delays or mistakes.

According to Barath Jayaraman [1], Manual refund tracking has several disadvantages: most customers must keep written notes to record pending refunds and their request dates. In particular, this process is labor-intensive and exasperating for customers. Secondly, even if customers keep accurate records of pending refunds, they have to check the status from time to time by accessing online banking interfaces and examining transaction lists to confirm receipt. This generates yet another painstaking and error-prone paper-based process that is thoroughly dissatisfying to the majority of customers, resulting in inefficiencies and customer dissatisfaction in

the digital banking space.

Additionally, Tining and Winarno [2] highlight that applying information and management systems in educational institutions offers numerous benefits. These encompass enhancing the effectiveness and efficiency of data collection, ensuring accuracy and real-time delivery, and establishing an organized, systematic work system. Additionally, they aim to maximize productivity and reduce costs by minimizing manual work and streamlining administrative operations.

Over the years, students at Saint Michael College of Caraga (SMCC) have mainly submitted their requests through manual processes. This traditional method has presented numerous challenges for students, staff, and administrators. One major issue is the lengthy time it takes to process requests, as multiple offices must review documents before approval. It causes significant inconvenience for students who need quick responses. There is also a greater risk of documents being lost or misplaced, as records are managed and stored physically. It increases the chances of errors, duplication, and delays. These problems slow down transactions and negatively affect the accuracy and reliability of school records.

To address service challenges at SMCC EDP, a web-based service platform could be created that enables users to submit and monitor their requests online and to send instant notifications to staff for quicker responses. This approach will reduce manual effort, eliminate errors, and ensure requests are fulfilled, resulting in greater efficiency and convenience as overall. By enabling better staff and client communication, the system

supports better organization, access, and service reliability. It promotes safer, lower-contact processes as the institution continues to advance its digitization.

The SMCC EDP needs to implement and optimize a web-based service request system to address existing inefficiencies, especially as the institution adapts to digital and contactless processes. Implementing this system can improve employees' productivity and performance by providing instant notifications, organized task tracking, and automated request handling, ensuring the continued efficiency, accessibility, and reliability of existing services.

1.2 Literature Review

This section outlines the relevant literature for the researchers' study, addressing the problems encountered. It focuses on the need to implement the researchers' proposed software application, its benefits, and the issues it addresses. The literature comes from electronic, sources such as e-books, websites, articles, and journals.

Digital Academic Request System with E-Payment and Notification for Efficient Tracking and Record Management

According to M.J. Pagay-Cierva et al., integrating e-payment and SMS notification features into mobile-based academic request systems significantly improved administrative efficiency, usability, and security in school record management [2]. Additionally, the studies of Alzahrani and Almuhanna, Mustapa et al., Ganeshan, Abilash et al., and the comprehensive review by Tining and Winarno, Chung and Kim, Gao et al., and Verma and Sharma also concluded that digital platforms with automated notifications and secure payment gateways streamline academic workflows, reduce manual errors, and

enhance user satisfaction through real-time updates, mobile accessibility, and secure authentication [2], [3], [4], [5], [6] In conclusion, digital academic request systems equipped with e-payment and notification features serve as pivotal innovations in streamlining institutional workflows, enhancing transparency, and promoting timely, user-centered communication—solidifying their essential role in the modernization of academic.

Student Request and Approval System

According to A.S. Bacud and G.P. Siddayao, implementing an Online Request System for academic records significantly enhances institutional efficiency, by providing secure document delivery, real-time status tracking, and automated notifications that reduce administrative workload and improve the user experience [7]. Similarly, K.T. Sudharshan emphasized that digital platforms like StudentSys streamline student-faculty interactions by automating request submission, approval workflows, and real-time updates, thereby improving transparency and reducing delays [8]. Ultimately, digital academic request systems play a vital role in modernizing institutional workflows by streamlining document processing, automating communication, and minimizing manual tasks—making them indispensable for efficient and reliable academic record management.

Automation & AI in Service Request Management

According to B. Jayaraman, digital banking systems that integrate notification features significantly enhance user experience by automating refund tracking and status updates. Users benefit from configurable alerts for pending, overdue, and completed

transactions, delivered via push notifications, emails, or SMS [1] Similarly, A. Basu and K. Banerjee reported that automated bots distributing service requests and sending reminders across platforms like Slack and Outlook improved task resolution and accountability [9] In conclusion, notification systems serve as indispensable elements of digital platforms, driving efficient communication, minimizing manual interventions, and significantly boosting the responsiveness and reliability of service delivery.

However, while Jayaraman emphasizes the benefits of proactive notifications in improving transparency and user control [1], Basu and Banerjee caution that excessive reminders may lead to user fatigue and stress, particularly under tight deadlines [9] . Their findings suggest that notification systems, if not carefully calibrated, can shift from being helpful to overwhelming. Although notification features are designed to enhance responsiveness, their implementation must balance automation with user tolerance to avoid unintended negative impacts on productivity and well-being.

Automated Communication and Status Updates for User Transparency

According to Acedo et al. [10] the core of the system was emphasizing real-time status updates and automated tracking. On the other hand, Nagrama et al. [11] relied more on the manual actions of users in submitting documents and navigating within the dashboard. This did not integrate automatic alerts or a dynamic notification of status changes. This reduces responsiveness and transparency in the system when dealing with time-sensitive workflows. Conclusion: Manual interaction restricts transparency in time-sensitive workflows; automated tracking guarantees real-time responsiveness and visibility.

Streamlining Educational Administrative Workflows with Web- Based and User-Centered Technologies

According to S.M. Alade et al. [12] reported that the WBEDMS considerably enhanced administrative efficiency in academic departments, achieving 96.6% user satisfaction and 99.2% usability by staff and secretaries. Similarly, J.B. Adra et al. [13] surmised that the Student Services Digital Records Management System improved document distribution, credential tracking, and compliance reporting within registrar offices; ISO 25010 evaluations rated high on usability, maintainability, and portability. On the other hand, H.I. Chunpir et al. [14] reported that while request tracking systems were integrated into the federated e-Science environment, user interfaces often remained non-intuitive, resulting in complex workflows for support and greater response times. In conclusion, academic administration has been highly enhanced by web-based document systems, offering high usability, satisfaction, and smoothing of credential workflows. However, poor interface design still creates barriers to the efficiency of support and timely responses in the case of federated e-Science environments.

1.3 Project Objectives

The researchers' study aims to develop an automated user service portal for Saint Michael College of Caraga's Electronic Data Processing, called E-Uniserv.

Specifically, it aims to:

1. Automate requests for refunds, ID replacements, password resets, Wi-Fi extensions, e-tarp designs, and documents, and solve tracking problems while

avoiding hard-copy record loss.

2. Implement an effective email notification system to inform stakeholders of the status of their requests.
3. Enhance monitoring and tracking by adding a digital dashboard with individual request IDs, instant status updates, and automated staff reminders.
4. Generate visual analytics and summary reports for administrative review.
5. Evaluate the system using ISO 25010 Standards to ensure its functionality, efficiency, and usability.
6. Enhance administrative efficiency and data protection in academic systems through digital records management integrated with two-way authentication and encryption of sensitive information.

1.4 Scope and Limitation

The Integrated Service Portal aims to design and develop an efficient request management platform for SMCC Electronic Data Processing (EDP), specifically implemented at Saint Michael College of Caraga, Nasipit, Agusan del Norte. The system is designed for use by students, faculty, and administrative staff to promote accessible, secure, and efficient service request management. The system includes ID verification before logging in, secure submission and tracking of service requests, management of administrative user accounts, generation of emails notifications, and automatic generation of summary and statistical reports.

The system can only handle service requests within the SMCC EDP and cannot process transactions from other departments or external users. It requires stable internet

access and compatible hardware, and its full capabilities rely on contemporary web browsers and email for notification and reporting purposes.

1.5 Definition of Terms

The terms defined below explain the basic concepts and factors discussed during the conceptualization and development of Integrated and contextual information on how the researchers apply these concepts in their study.

Administrator (Superuser) – Refers to the assigned personnel or EDP staff who has complete authority over the Integrated Service Portal. The administrator is responsible for user account approval, school ID validation, request management, report summarization, and monitoring the system operations.

Email Notification – Refers to the automatic notification sent via email is sent to clients to notify them of the status of their request, especially when it is ready for collection. In this research, it serves as a means of communication between stakeholders and the system, avoiding unnecessary follow-ups and providing timely updates.

Electronic Data Processing (EDP) – Refers to the office in the Saint Michael College of Caraga, which is responsible for monitoring, organizing, and processing digital data. In this project, EDP is the primary unit that receives, monitors, and resolves service requests.

G Suite Account – Refers to the school-provided Google account for students, teachers, and staff, used to log in to the Integrated Service Portal. It ensures that only verified Michaelinians can access and use the system.

Integrated Service Portal– Refers to the web-based service request platform developed for SMCC EDP that automates the submission, tracking, and processing of requests. It

replaces manual and paper-based processes with an efficient, secure, and accessible online system.

Real-time Dashboard – Refers to the system function that makes administrators have real-time access to service request information, including request frequency, pending transactions, and processing times. It promotes transparency and facilitates more efficient monitoring of progress.

Request Handling – Refers to the overall process of handling user requests within the ISP, from submission and verification to approval and fulfillment. This research encompasses the administrator's activity of examining, approving, and modifying requests, as well as the system's ability to inform users that their requests are available to claim.

School ID Upload – Refers to the requirement for users to upload a valid school identification card before account approval. The process ensures that access to the Integrated Service Portal is strictly limited to legitimate Michaelinians (students, teachers, and staff).

Stakeholders – Refers to users and people participants in the operation of the system, i.e., students, personnel, and EDP staff. Stakeholders gain from faster processing, greater transparency, and better access to EDP services.

Summary Reports – Refers to the system-generated reports that automatically result from collected data from requests. Summary reports in this project include statistical data on processing times and requests frequency, which administrators can print for decision-making and monitoring.

CHAPTER II

METHODOLOGY

2.1 Research Design

This study will use a Design and Development Research (DDR) approach, focusing on the creation and evaluation the *Integrated Service Portal* as a technology-based solution to improve EDP operations.

2.2 Software Development Life Cycle

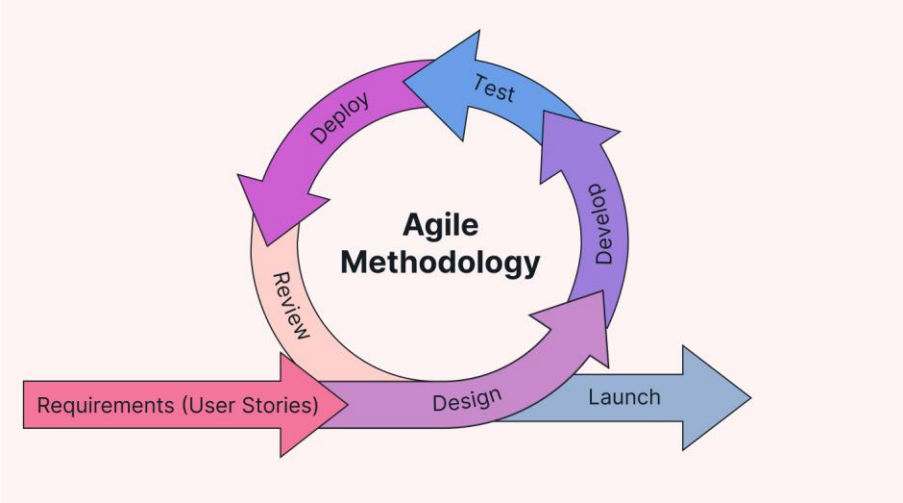

Figure 1. Agile Methodology

The development of the Integrated Service Portal for Saint Michael College of Caraga's Electronic Data Processing (SMCC EDP) will adopt the Agile Software Development Life Cycle as depicted in Figure 1, emphasizing iterative progress, stakeholder collaboration, and continuous refinement. Instead of following a rigid, linear process, the project will be broken down into short development cycles, or sprints, each focused on building and improving specific features, such as secure user authentication, real-time request tracking, automated email notifications, and visual analytics for

administrative review. The process begins with gathering requirements from EDP staff and users to identify key challenges in the current manual system. Each sprint will involve designing, developing, and testing modules such as the request submission form, dashboard, and reporting tools, with stakeholder feedback integrated regularly to ensure the system aligns with user needs. After several iterations, the portal will be deployed and continuously enhanced based on user input and performance evaluations in accordance with ISO 25010 standards. This Agile approach ensures that the ISP remains efficient, user-centered, and adaptable to the evolving digital needs of SMCC.

2.3 System Architecture

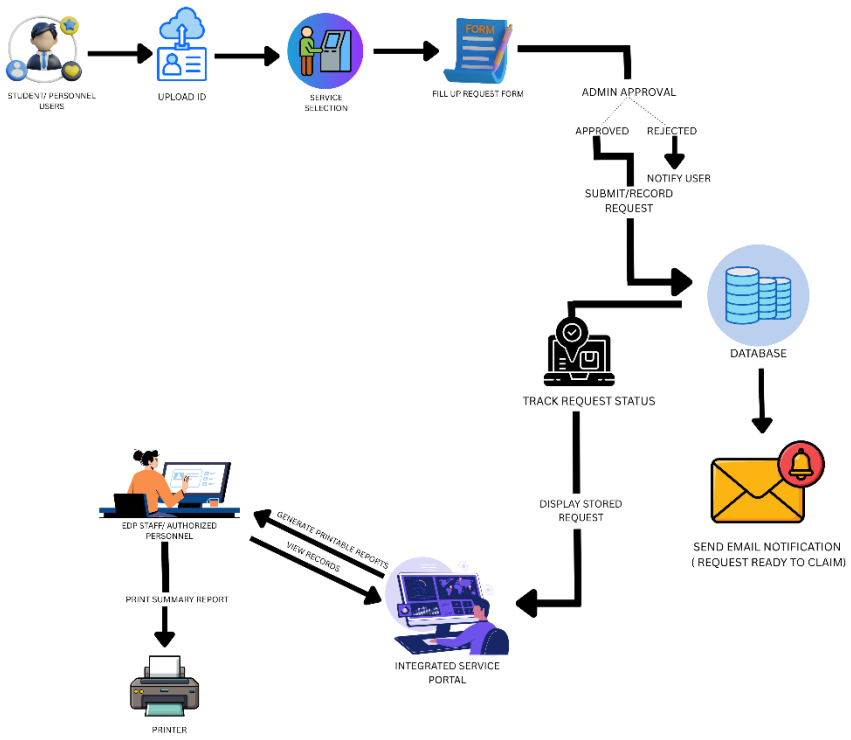

Figure 2. E-Uniserv (System Architecture)

Figure 2 shows the entire process of utilizing the system. The initial step for the personnel and student is to upload their ID, select the required service type, and complete

the request form. Upon submission, the request goes through the admin approval process. In the event of rejection, the user will be notified immediately. If approved, the system will record the request and submit it to the database. After being recorded, the request can be tracked by the user through the system, where the status is displayed. The stored request is also available in the integrated service portal, where EDP personnel or authorized users can view records, create printable reports, and print summary reports as needed. Additionally, once the request has been processed and is ready for claiming, the system will send an automatic email notification to the user. This ensures that all requests are effectively tracked, recorded, and communicated, while maintaining appropriate access control for authorized users only.

2.4 Conceptual Framework

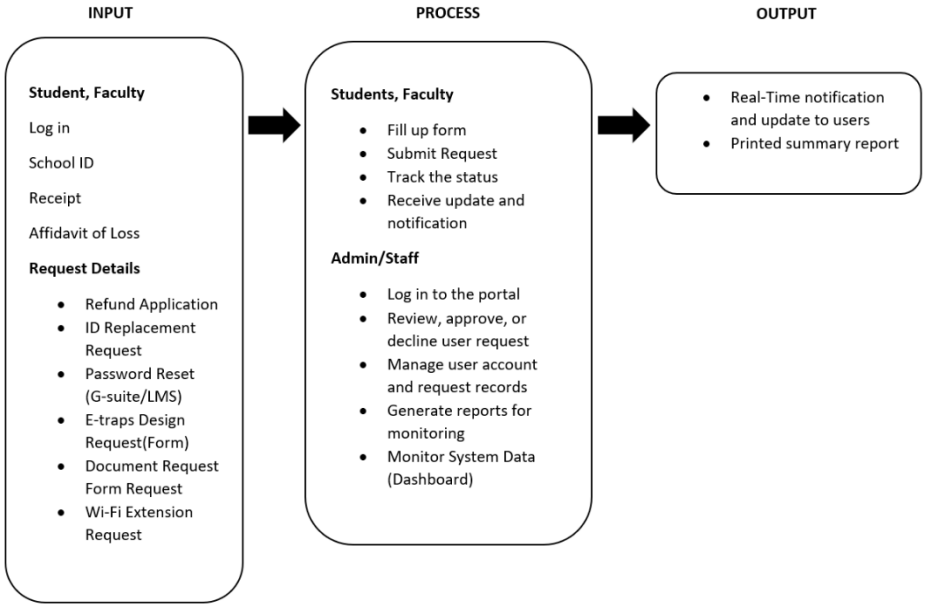

Figure 3. Input-Process-Output Diagram

Figure 3 presents the Input-Process-Output (IPO) diagram of the proposed Integrated Service Portal. The Input stage includes requirements from students and

faculty, such as login credentials, school ID, receipts, affidavits of loss, and specific requests such as tuition fee refunds, password resets, ID replacements, Wi-Fi extensions, e-tarp designs, and document request forms. Under the Process stage, learners and teachers' complete forms and submit requests via the portal, while admin or EDP personnel log in to the dashboard to check system data, approve/reject requests, manage users, notify them of results in real time, and create reports. The Output is the Integrated Service Portal, which simplifies service requests and transactions, followed by an Evaluation to determine its efficiency and effectiveness.

2.5 Use Case Diagram

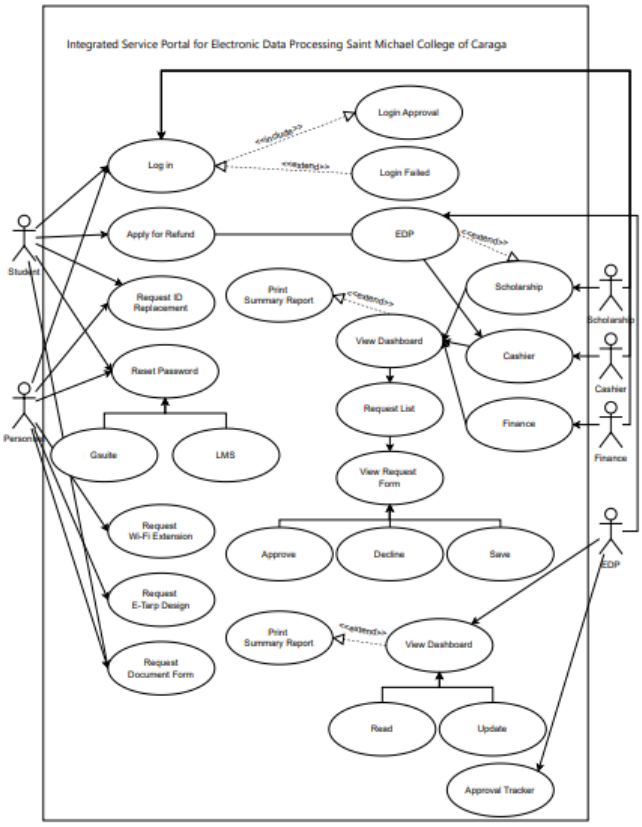

Figure 4. Use Case Diagram

Figure 4 illustrates how various users interact with the Integrated Service Portal of Saint Michael College of Caraga. Each actor (Student, Personnel, Scholarship etc.) views specific system functions such as login, requests, approvals, and data management. It lays out role-based access to services in order to provide efficient electronic data processing.

2.6 Activity Diagram

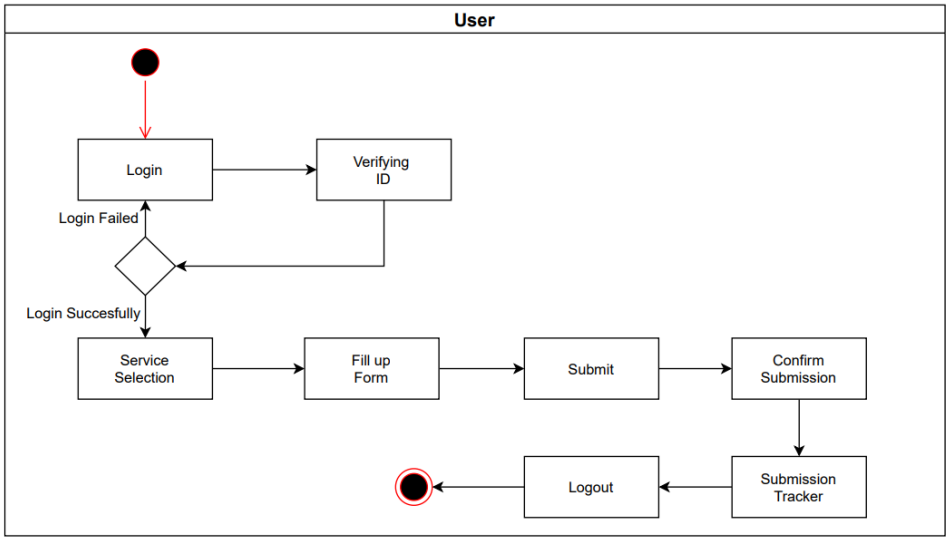

Figure 5. Activity Diagram- User

Figure 5 illustrates the user activity flow within the system**.** The process begins with login and ID verification; if invalid, the user is prompted to re-enter credentials. Once verified, the user proceeds to service selection, fills out the request form, and submits it. The system confirms the submission and records it through the tracker. Finally, the user can log out to end the session.

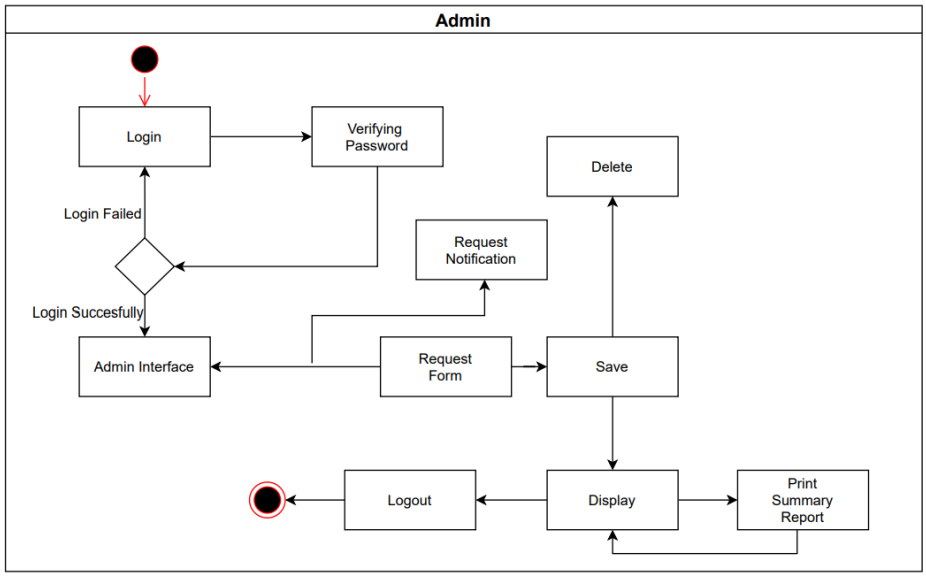

Figure 6. Activity Diagram- Admin

Figure 6 illustrates the system's admin functions. The admin logs in, and the system handles authentication. Inside, the admin can view IDs, receipts, request forms, and affidavits retrieved from the database. The admin can delete entries, which also updates the database. Following confirmation of changes, the admin logs out to close the session.

2.7 Sequence Diagram

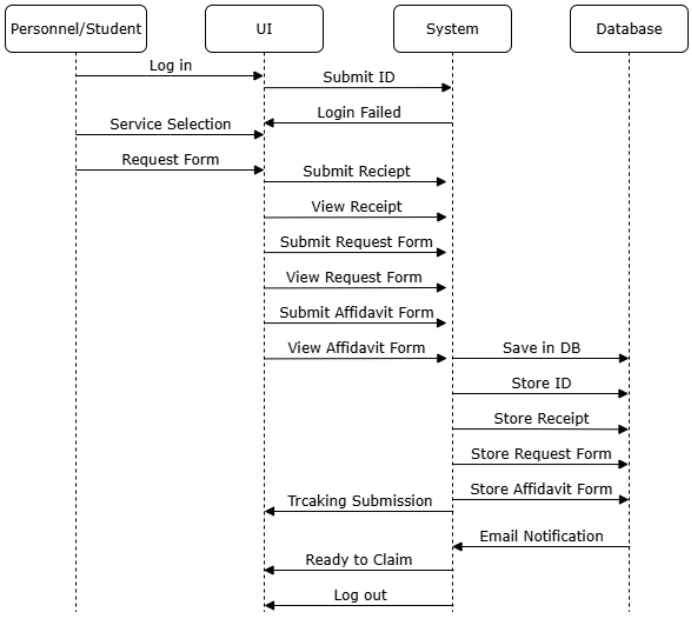

Figure 7. Sequence Diagram- Personnel/ Student

Figure 7 illustrates the system's sequence flow. The procedure starts when staff or students log in via the UI and provide their ID for authentication. Upon successful login, users can choose services, upload receipts, request forms, or AF Davits, and view their submissions. These inputs are processed by the system and stored securely in the database. Users can monitor the status of their submissions, receive email notifications for ready-to-claim requests, and log out to complete the session.

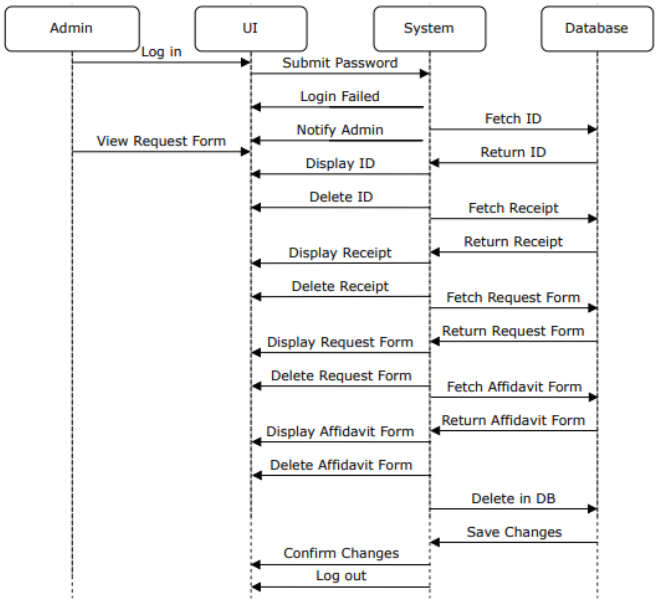

Figure 8. Sequence Diagram- Admin

Figure 8 illustrates the steps available to administrators in the system. The admin logs in, and the system handles authentication. Inside, the admin can view IDs, receipts, request forms, and affidavits retrieved from the database. The admin can delete entries, which also updates the database. Following confirmation of changes, the admin logs out to close the session.

2.8 Entity Relationship Diagram

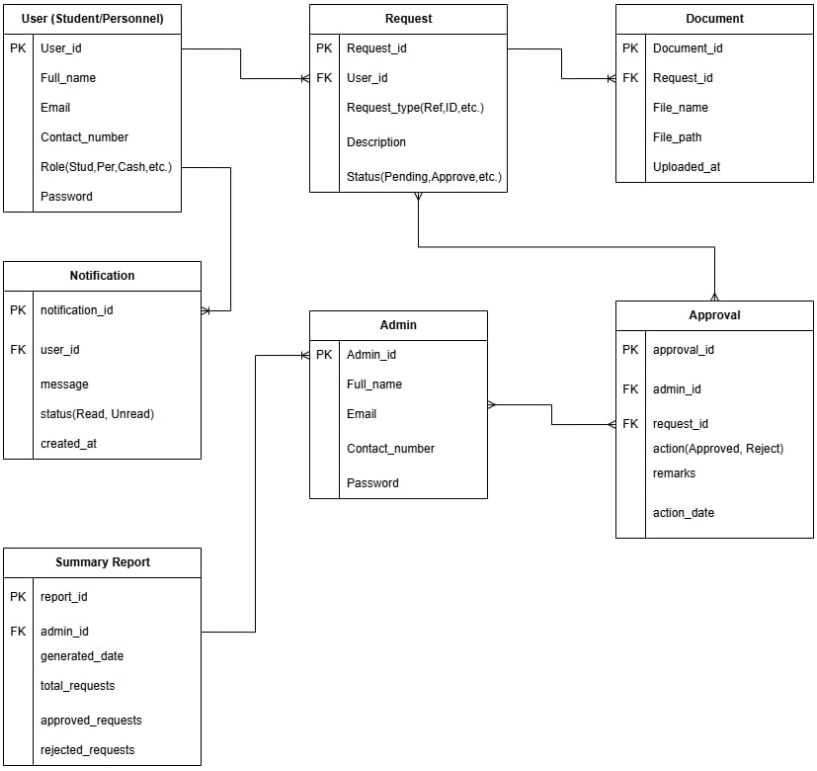

Figure 9. Entity Relationship Diagram- Database Design

Figure 9 shows the Entity-Relationship Diagram (ERD) outlines a structured document request and approval system, primarily serving students and personnel. At the center is the **User** entity, which holds personal and login credentials and connects to multiple **Requests**—establishing a **one-to-many (1:M)** relationship, as each user can submit several requests. Each **Request** is linked to a single **Document**, forming a **one-to-one (1:1)** relationship, and is also subject to a single **Approval** by an **Admin**, again a **one-to-one (1:1)** relationship. The **admin** entity, however, can approve multiple requests, creating a **one-to-many (1:M)** relationship with **Approval**, and can generate multiple **Summary Reports**, also a **one-to-many (1:M)** relationship. Users receive multiple **Notifications**, forming another **one-to-many (1:M)** relationship. These cardinalities

ensure that the system supports scalable user interactions, traceable administrative actions, and efficient communication, while maintaining data integrity across document handling, approval workflows, and reporting

2.9 PROTOTYPE

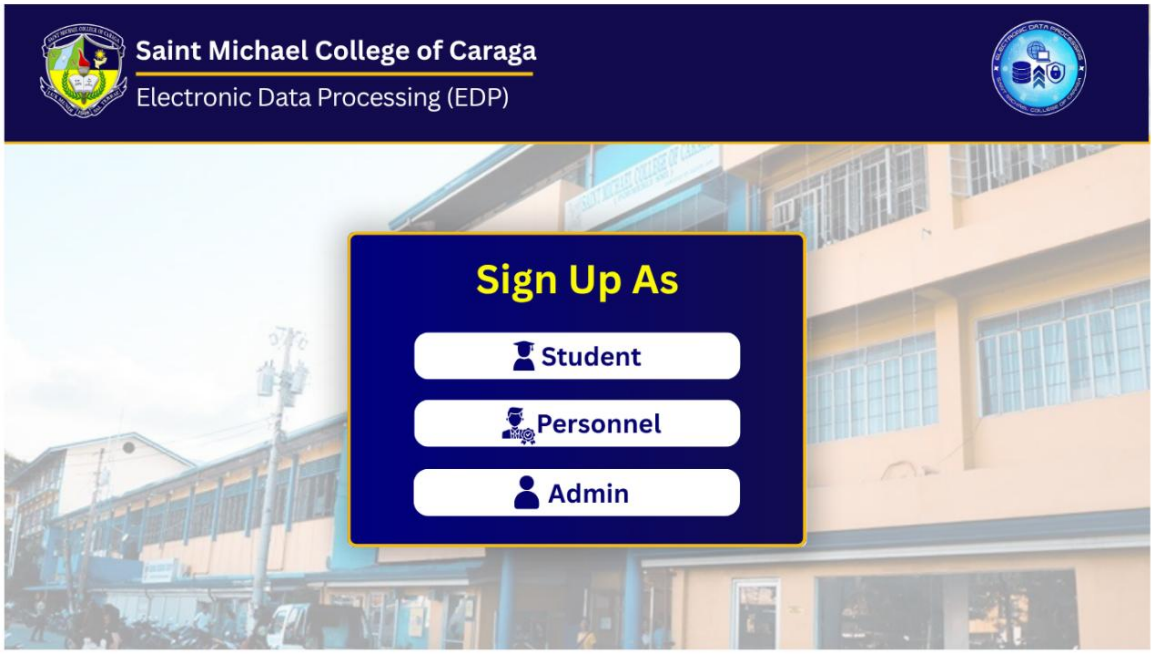

Figure 10. Sign Up as Per Status- Personnel/ Student User

Figure 10 depicts the registration interface of Saint Michael College of Caraga's Electronic Data Processing (EDP) system. The user may opt to register as a Student, Personnel, or Admin, each option represented by a clickable button.

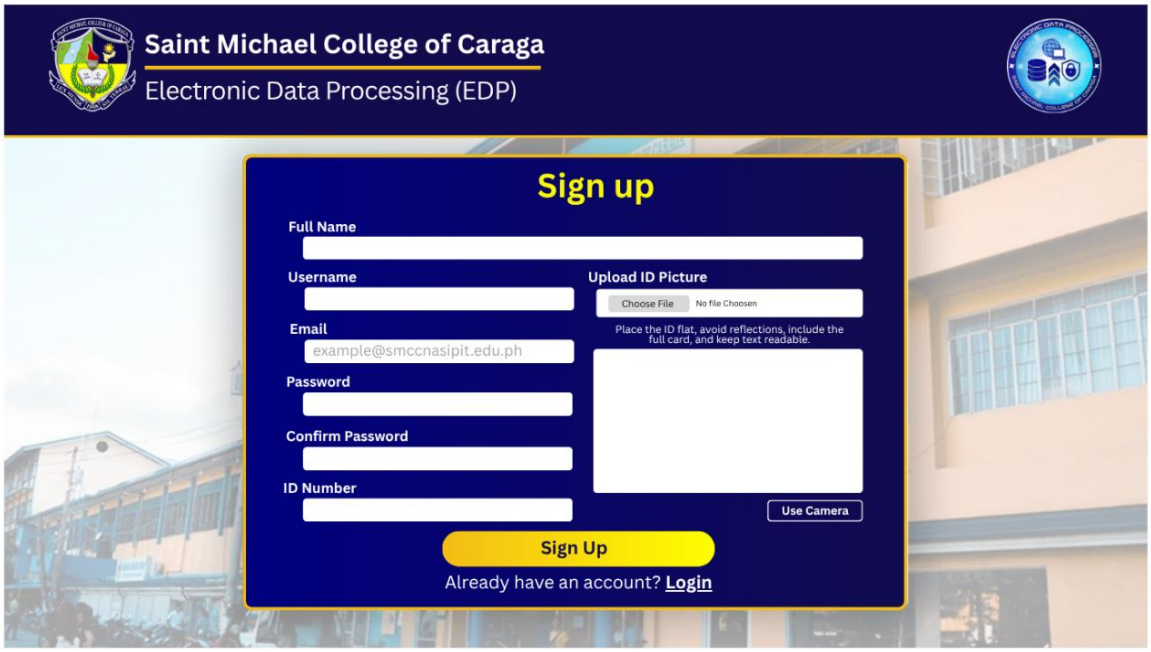

Figure 11. Sign Up Form- Personnel/ Student User

Figure 11 shows the form of Saint Michael College of Caraga's EDP system tailored for use by Personnel and Student users. It collects necessary information, such as name, email address, ID number, and photo ID, to ensure safe access to academic and administrative facilities. This Admin role is not part of this registration process, probably handled by a different process.

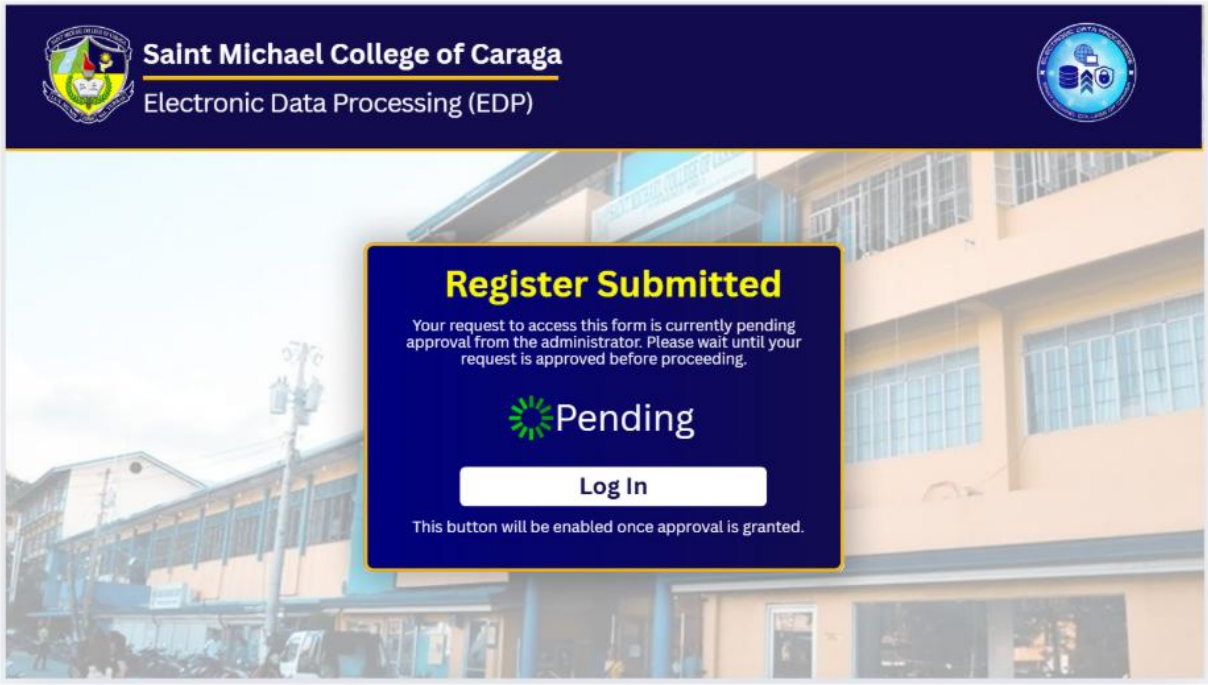

Figure 12. Register Pending Form- Personnel/ Student User

Figure 12 illustrates a confirmation page from Saint Michael College of Caraga's EDP system. It lets the user know that their registration request is awaiting administrator approval, and that the login button will be active once approved.

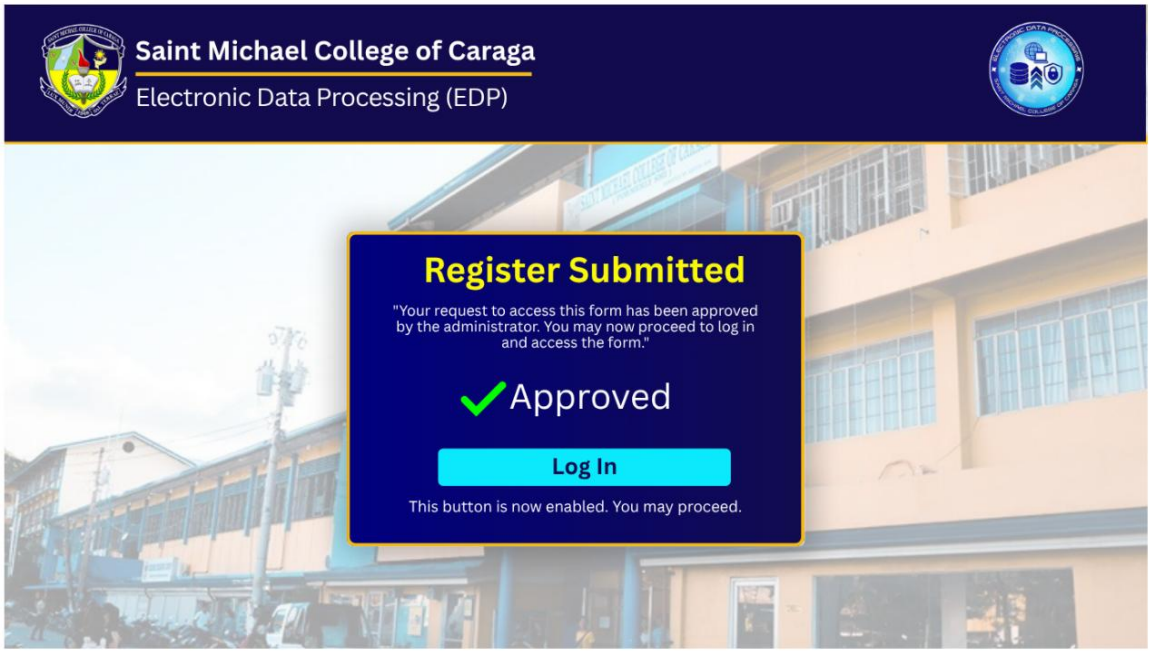

Figure 13. Register Approved Form- Personnel/ Student User

Figure 13 assures us that a user's application for registration in Saint Michael College of Caraga's EDP system has been approved. The interface shows an active "Approved" status and an "active" "Log In" button, which means the user can now enter the system.

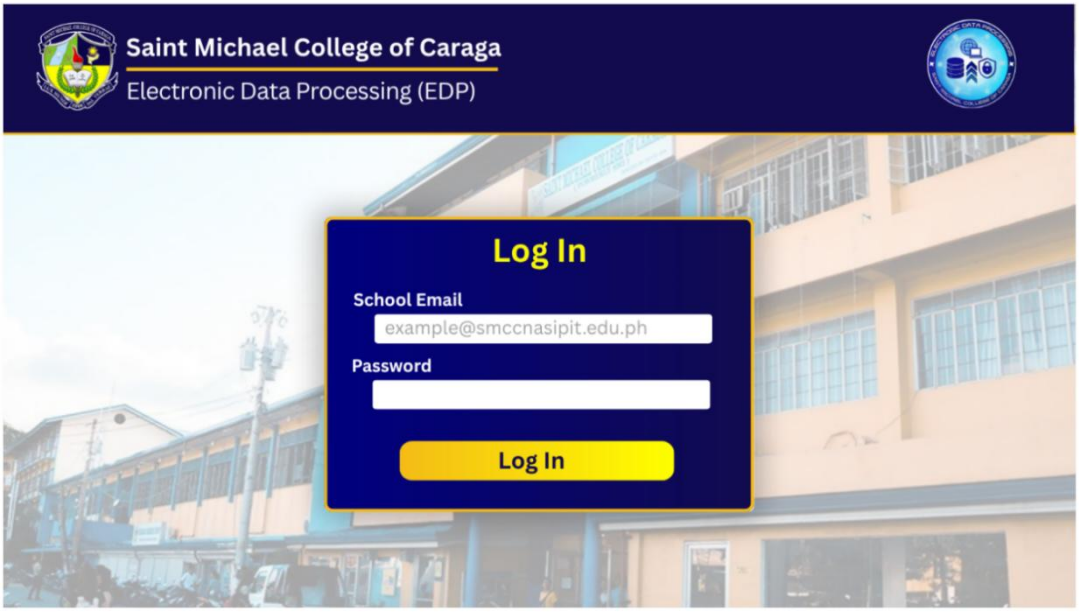

Figure 14. Log In Form - Personnel/ Student User

Figure 14 illustrates the EDP system login interface for Saint Michael College of Caraga. Users enter their school email and password to access academic or administrative functionality, with a neat design against a background of a campus building.

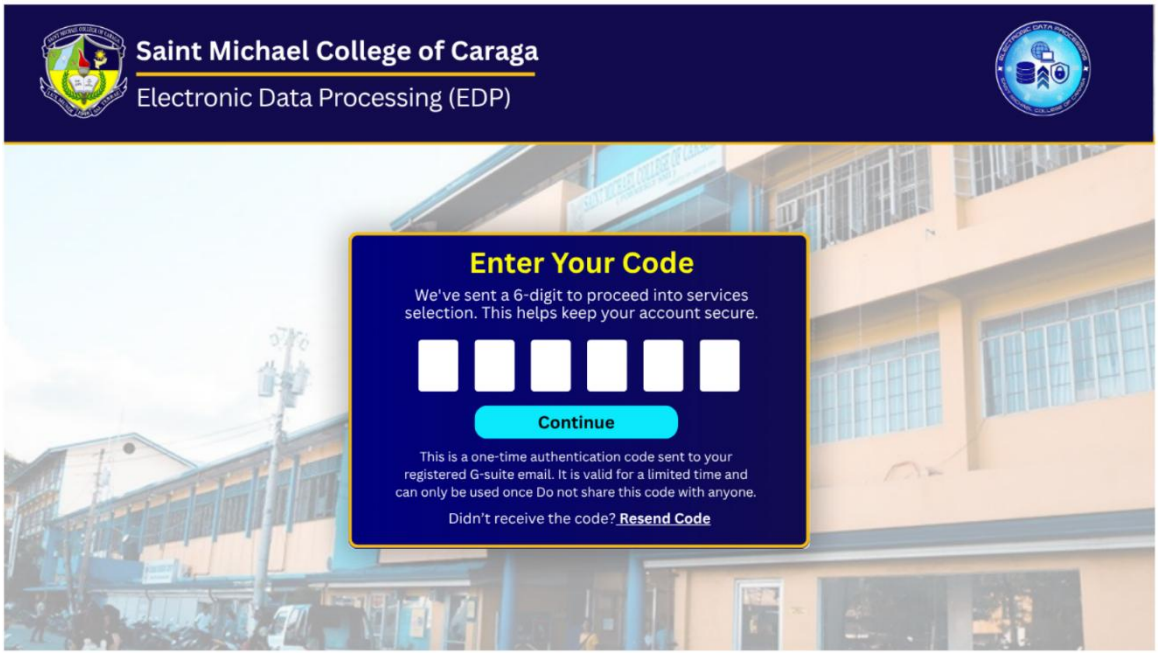

Figure 15. Authentication Code- User/ Admins

Figure 15 shows the authentication page for Saint Michael College of Caraga's Electronic Data Processing (EDP) system. Users must enter a 6-digit one-time code sent to their registered G-suite email to access service options. It ensures account security and includes a "Resend Code" link if the code wasn't received.

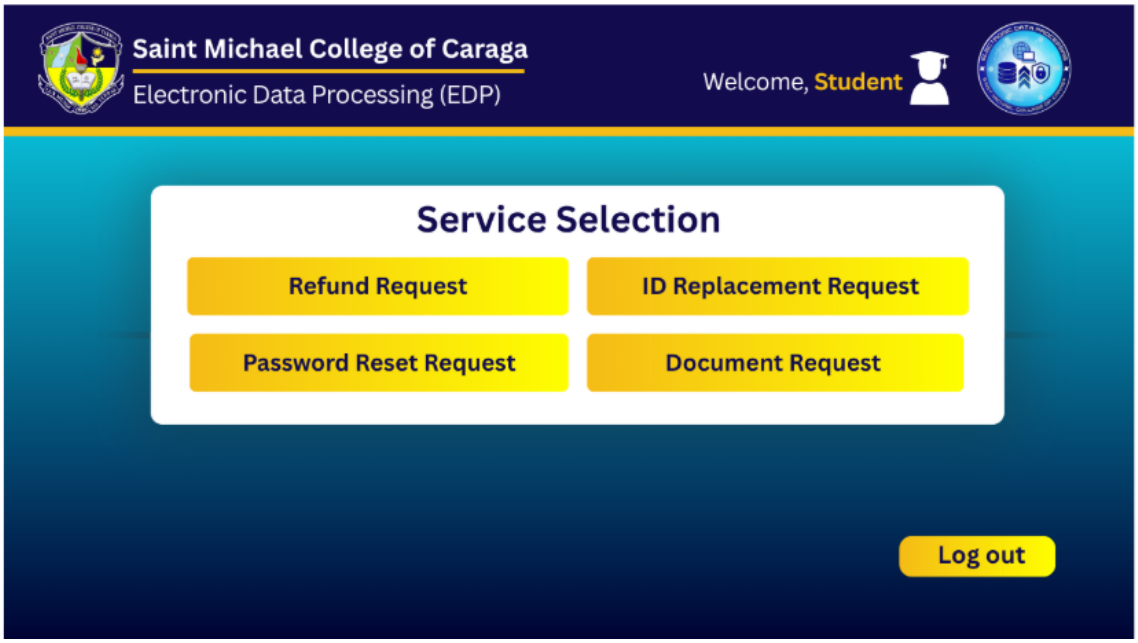

Figure 16. Service Selection Form- Student User

Figure 16 depicts the "Service Selection" page from Saint Michael College of Caraga EDP system. It presents students with four virtual service options — Refund Request, ID Replacement, Password Reset, and Document Request — each available via clearly labeled buttons. The interface is for easy access to administrative assistance.

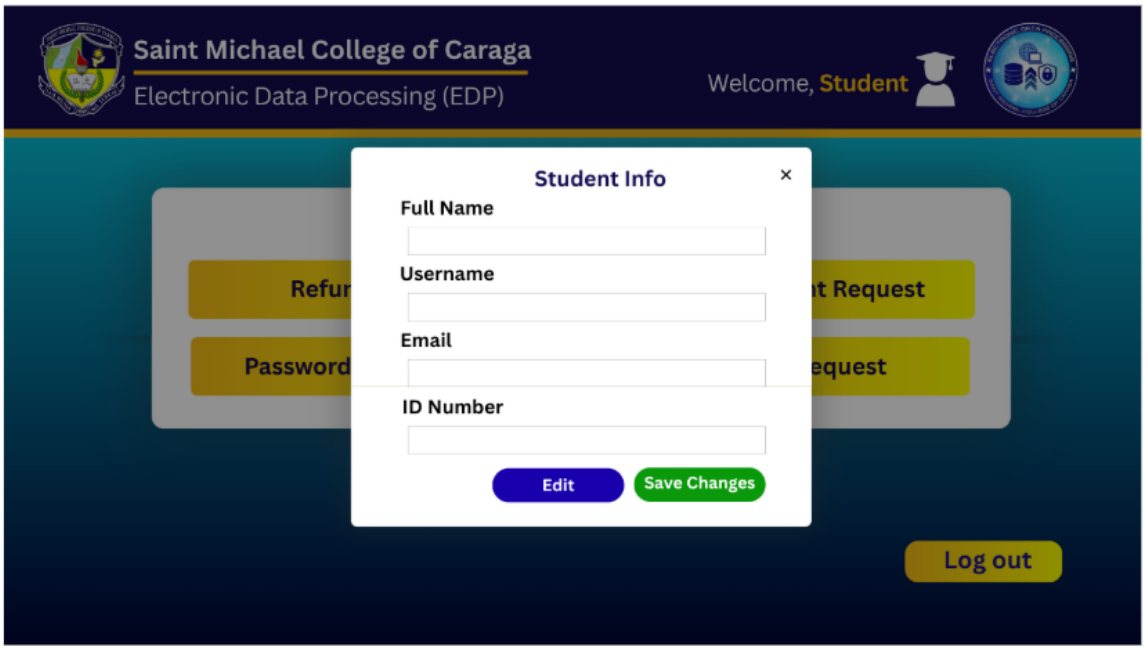

Figure 17. User Profile- Personnel/ Student

Figure 17 depicts the profile section in the student interface of the EDP system, which is designed with four major functions that support account management and service tracking. Student/ Personnel Info enables the user to view and confirm their personal and academic information stored in the system. Change Password offers a secure method of updating one's login credential for the maintenance of account privacy. History Services permits students to go through their various request submissions for transparency and reference to actions completed or pending. Lastly, sign out ensures secure exit from the system, preventing unauthorized access to student data.

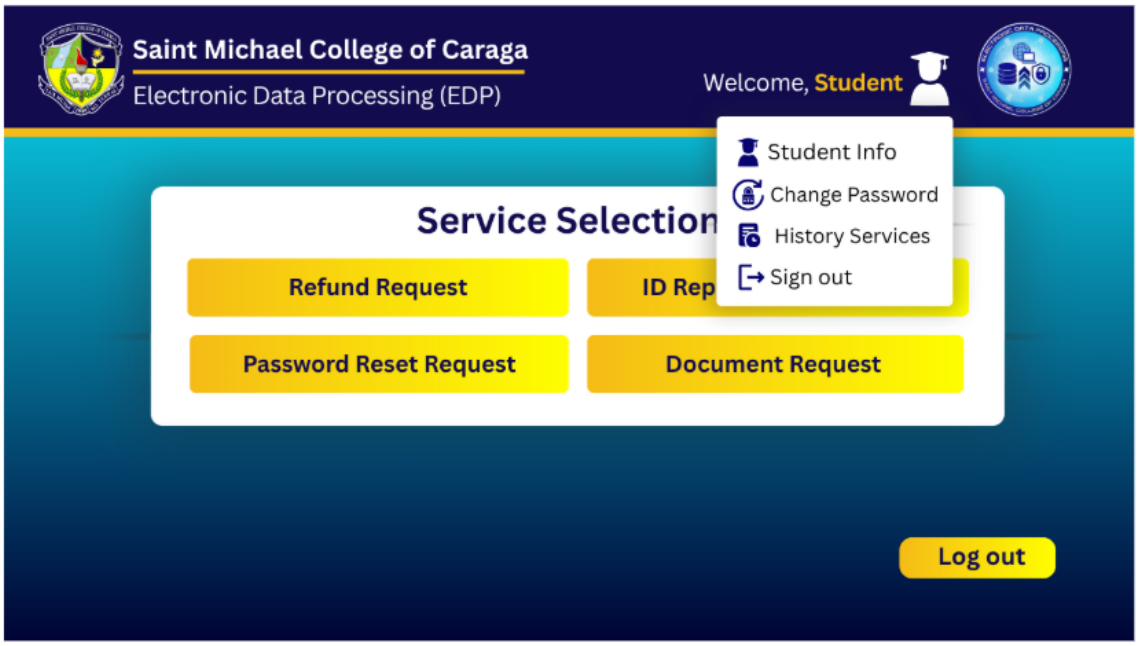

Figure 18. Student/ Personnel Info User

Figure 18 shows the Student Info provides the interface through which students will be able to view and edit their personal information within the EDP system. It contains fields that allow editing: Full Name, Username, Email, and ID Number. Changes to these

fields are made active through the "Edit" button, and the changes will be confirmed and saved by "Save Changes". This ensures that all student records remain current and accurate.

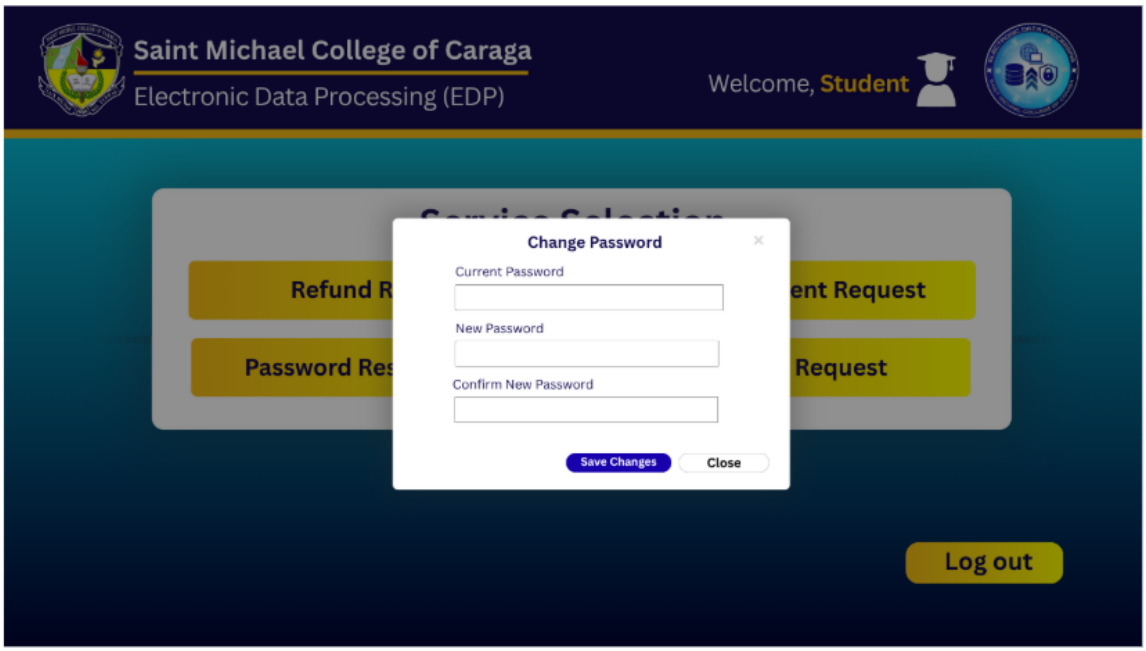

Figure 19. Change Password- User

Figure 19shows the change password modal window allows students to securely update their login credentials within the EDP system. It includes form fields for the current password, new password, and confirmation of the new password. The "Save Changes" button applies the update, while the "Close" button exits the window without saving. This function helps maintain account security and user control over access.

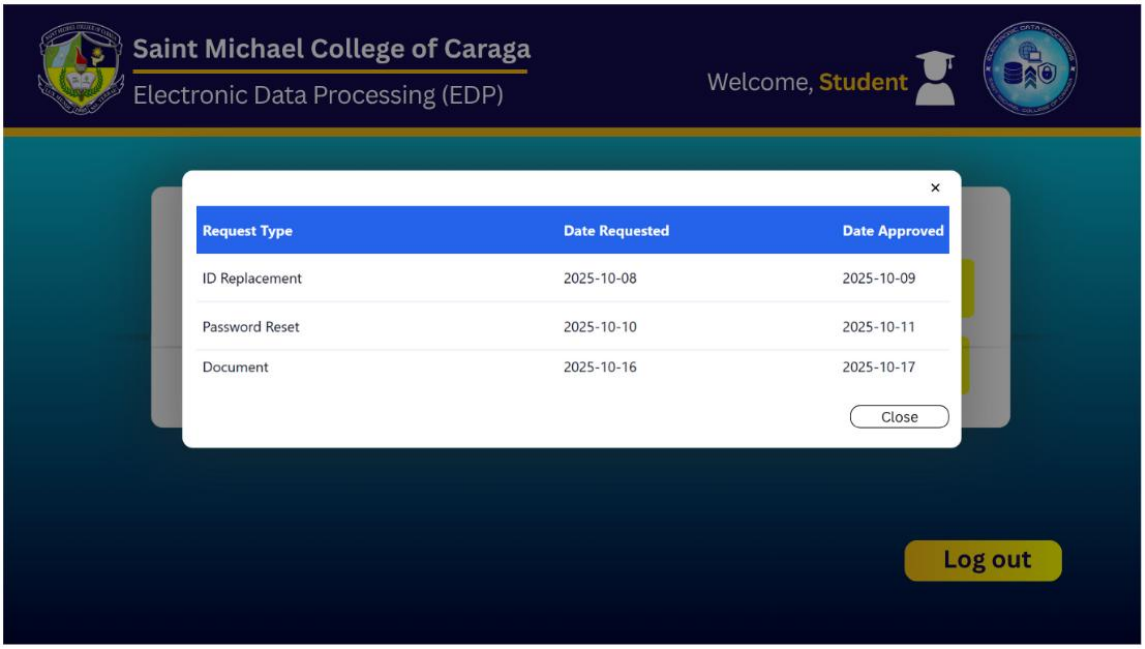

Figure 20. Request History- User

Figure 20 shows the student's service history within the EDP system. It contains a table with three columns: Request Type, Date Requested, and Date Approved for clear viewing of the status and approval dates of submitted requests. It allows better transparency for the users and allows them to keep track of their interactions with the system.

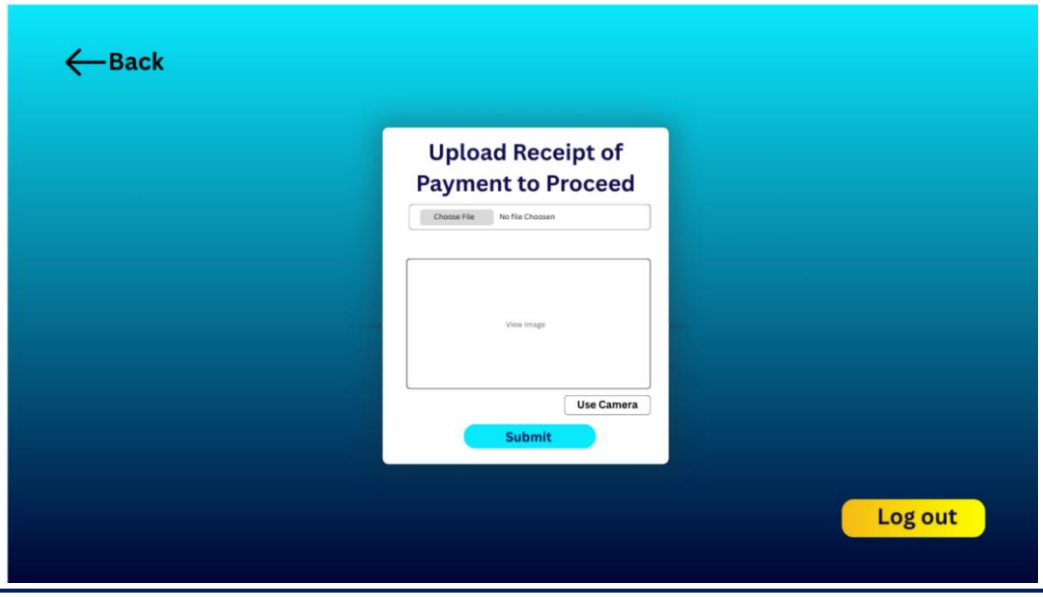

Figure 21. Upload Receipt Form for Refund- Student User

Figure 21 shows validates that the user has effectively submitted a proof of payment via Saint Michael College of Caraga's Electronic Data Processing system. The form provides the option to upload a file or use the camera, and pressing the "Submit" button initiates the approval process.

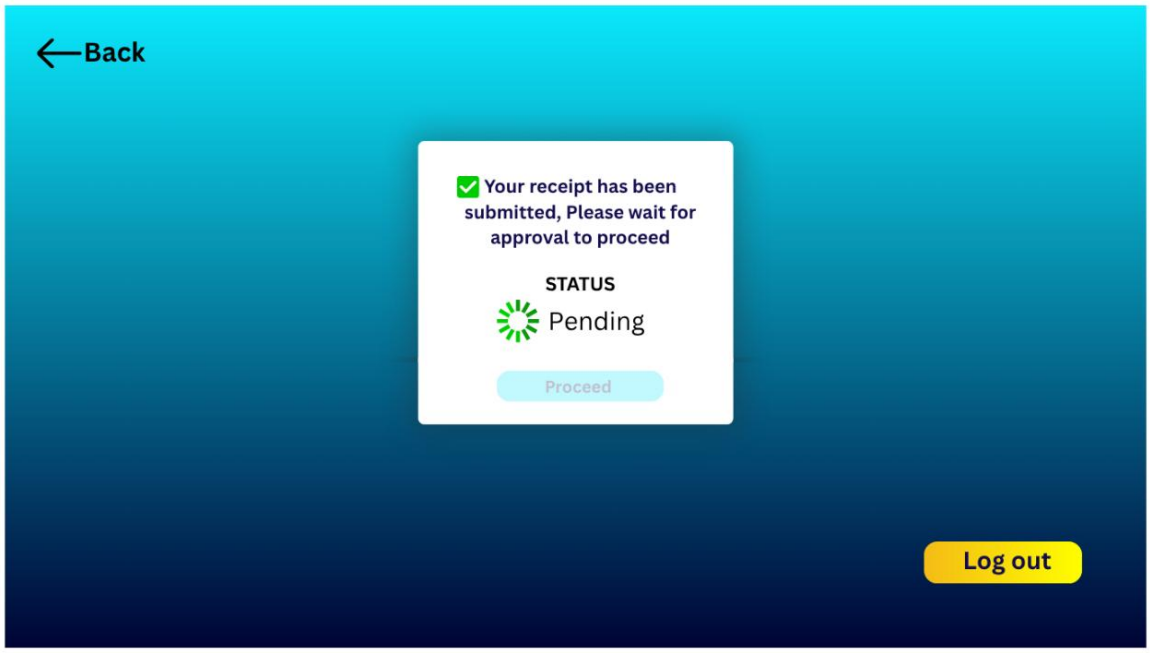

Figure 22. Pending Record Form for Refund- Student User

Figure 22 shows that a payment receipt has been filed via the EDP system and is awaiting approval. The "Proceed" button is inactive, so the user must wait for authentication before proceeding with the refund request.

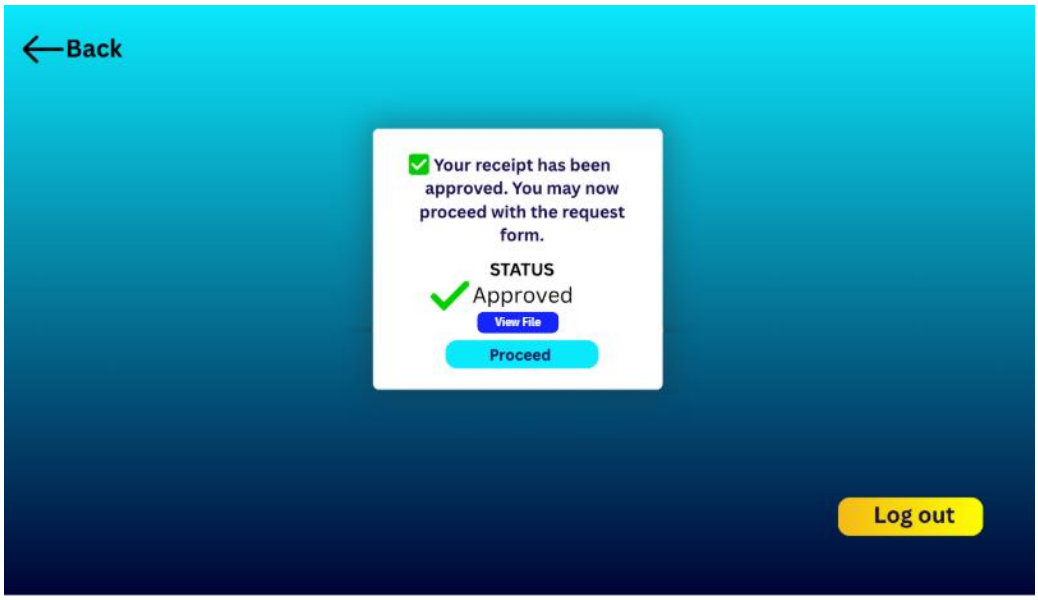

Figure 23. Approved Form for Refund- Student User

Figure 23 verifies that the submitted receipt has been received and that the user can now proceed to the next step in the request process. Two action buttons are available: "View File" to access the approved receipt, and "Proceed" to continue with the next step. This interface ensures clarity and guides the user efficiently through the approval workflow.

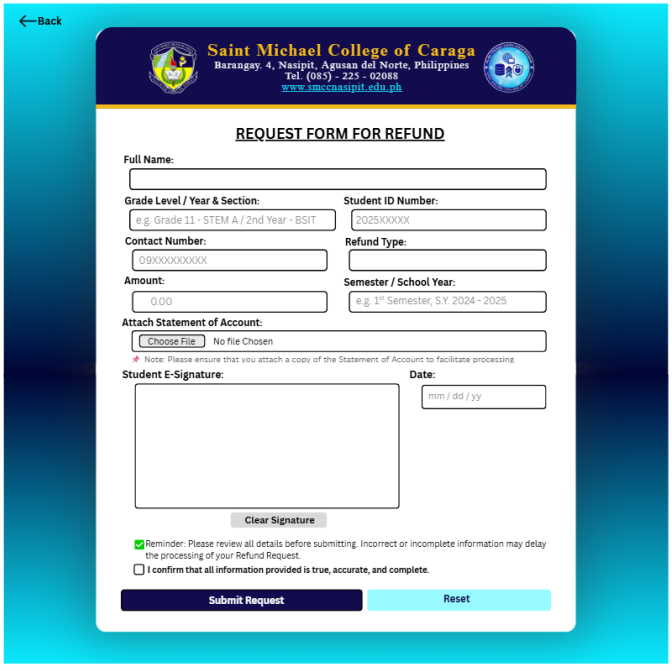

Figure 24. Request Form for Refund -Student User

Figure 24 request form is used to capture important student information, such as name, ID number, grade level, and contact information. It also requires selecting the refund type, indicating the semester, and attaching a Statement of Account to process the refund. It includes a student e-signature and date field, along with a confirmation statement to ensure all information is accurate before clicking "Submit Request."

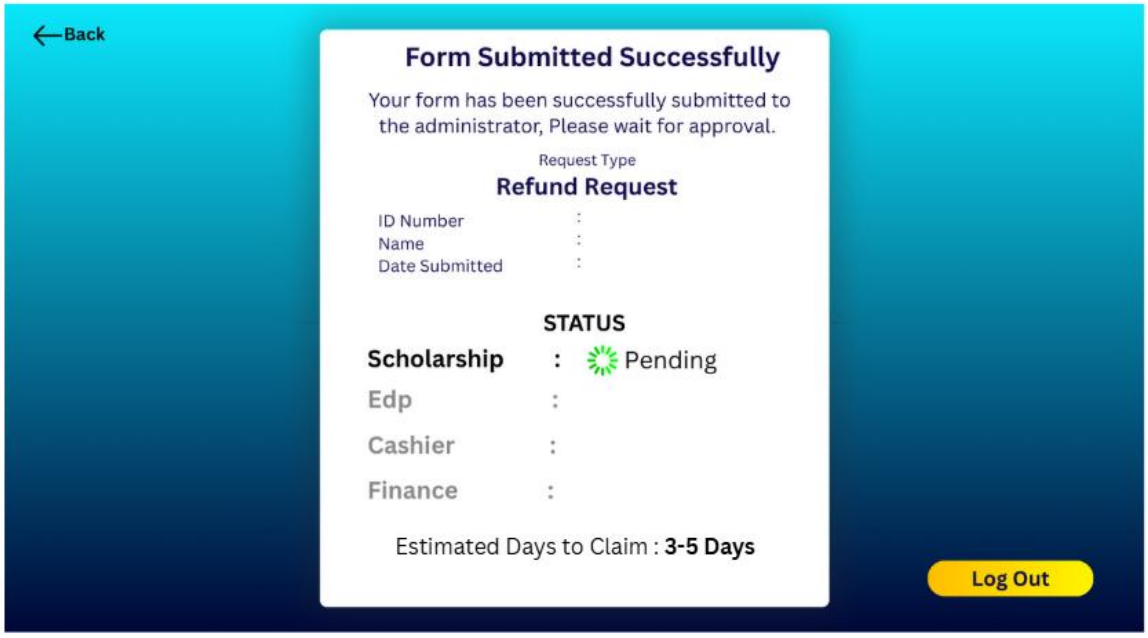

Figure 25. Refund Request Status Form- Student User (Scholarship Refund)

Figure 25 shows the confirmation page indicating that a refund request has been submitted successfully and is pending approval by the Scholarship department. The EDP, Cashier, and Finance statuses are all left blank, indicating that the reviewing process has just begun.

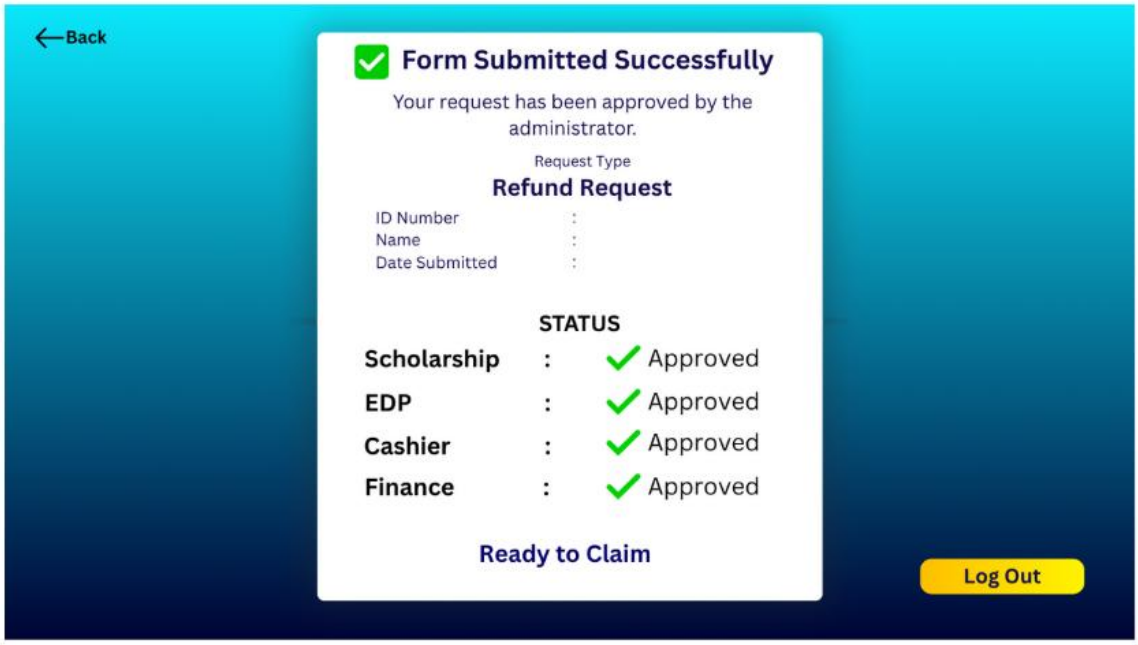

Figure 26. Refund Request Status Form- Student User (Scholarship Refund)

Figure 26 illustrates that a refund request has been successfully applied and approved by the Scholarship, EDP, Cashier, and Finance departments. The status "Ready to Claim" indicates that the user can now proceed to receive the approved refund.

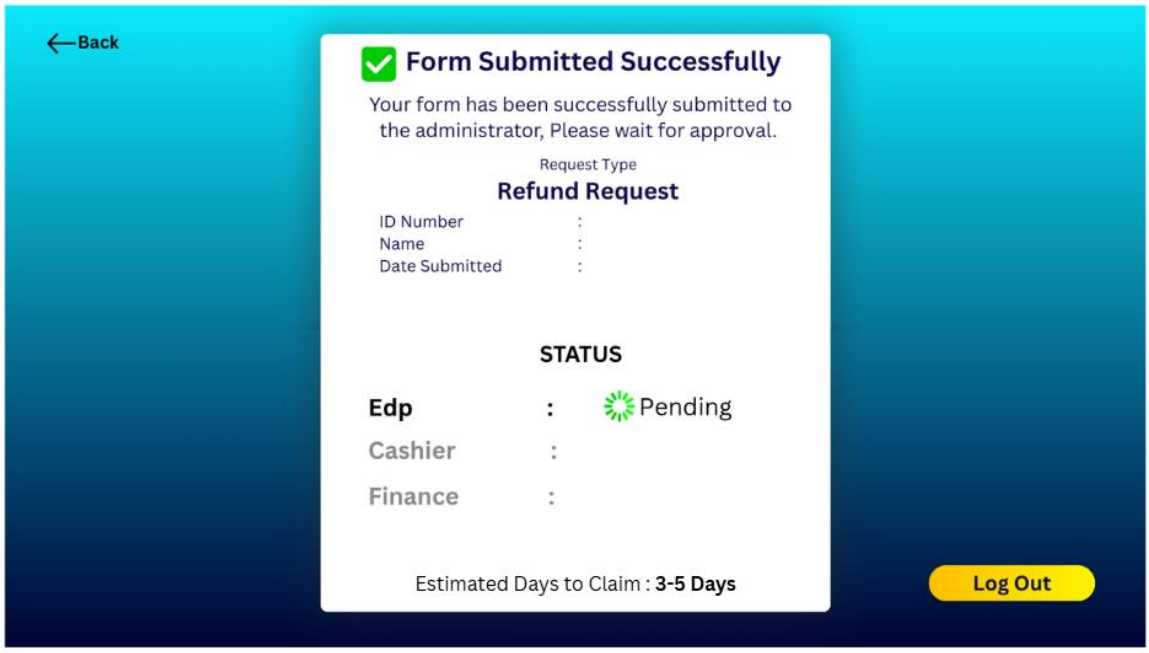

Figure 27. Refund Request Status Form- Student User (Regular Refund)

Figure 27 shows the verification screen indicating that a refund request has been successfully sent and awaiting EDP department approval. The Cashier and Finance statuses are again blank, indicating the review process is just beginning.

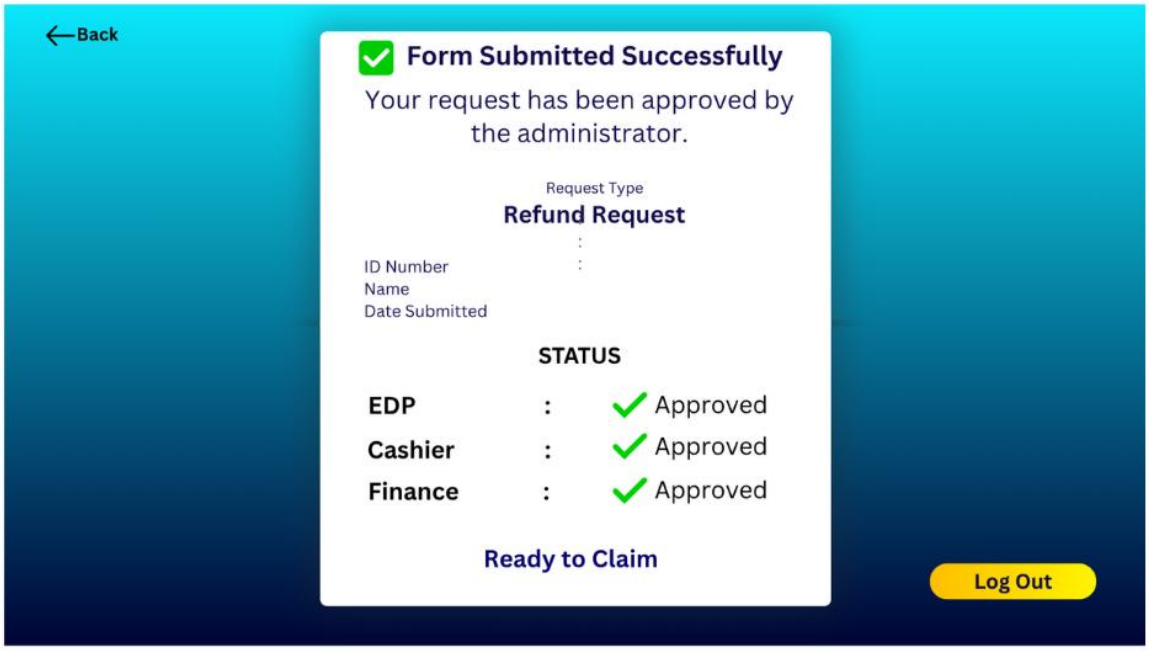

Figure 28. Refund Request Status Form-Student User (Regular Refund)

Figure 28 shows that a refund request has been successfully submitted and cleared by the EDP, Cashier, and Finance units. The status "Ready to Claim" indicates that the user can now proceed to receive the approved refund.

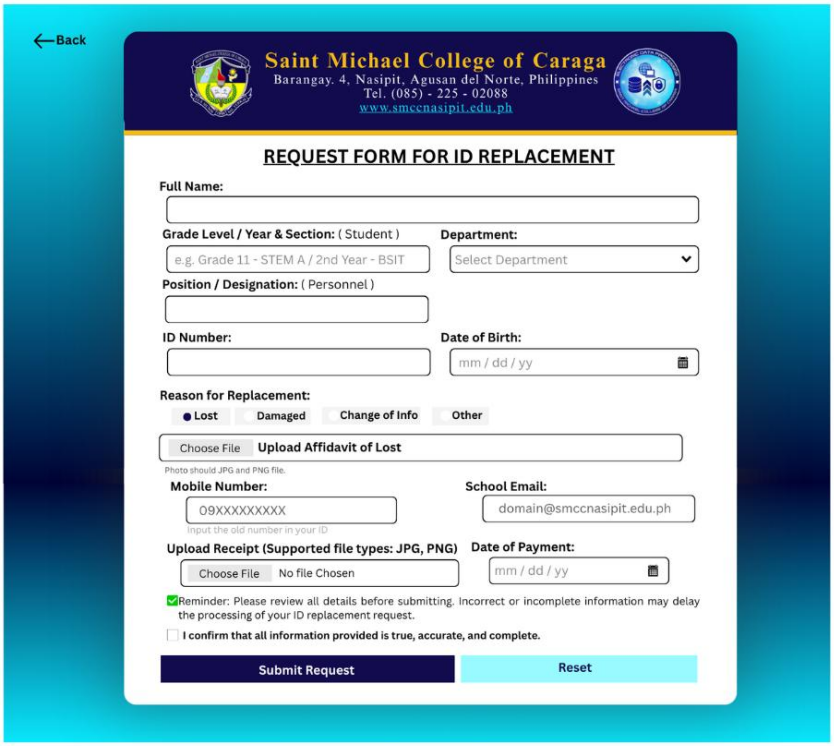

Figure 29. ID Replacement Request Form- Personnel/ Student User

Figure 29 shows that Saint Michael College of Caraga students can apply for a replacement school ID by stating personal information, academic data, and the replacement reason. It also includes an upload area for attachments, such as an affidavit of loss.

Figure 30. ID Replacement Request Form- Personnel/ Student User

Figure 30 shows that Saint Michael College of Caraga allows students to request replacement of their school ID by inputting personal information, academic data, and purpose of the replacement. It also includes an upload area for supporting documents, such as a photo of the damaged ID.

Figure 31. ID Replacement Request Form- Personnel/ Student User

Figure 31 shows the Saint Michael College of Caraga school ID replacement form, which enables students to request a replacement of their school ID by submitting personal and academic information, along with the justification for replacement. It provides space for the change-of-info cases.

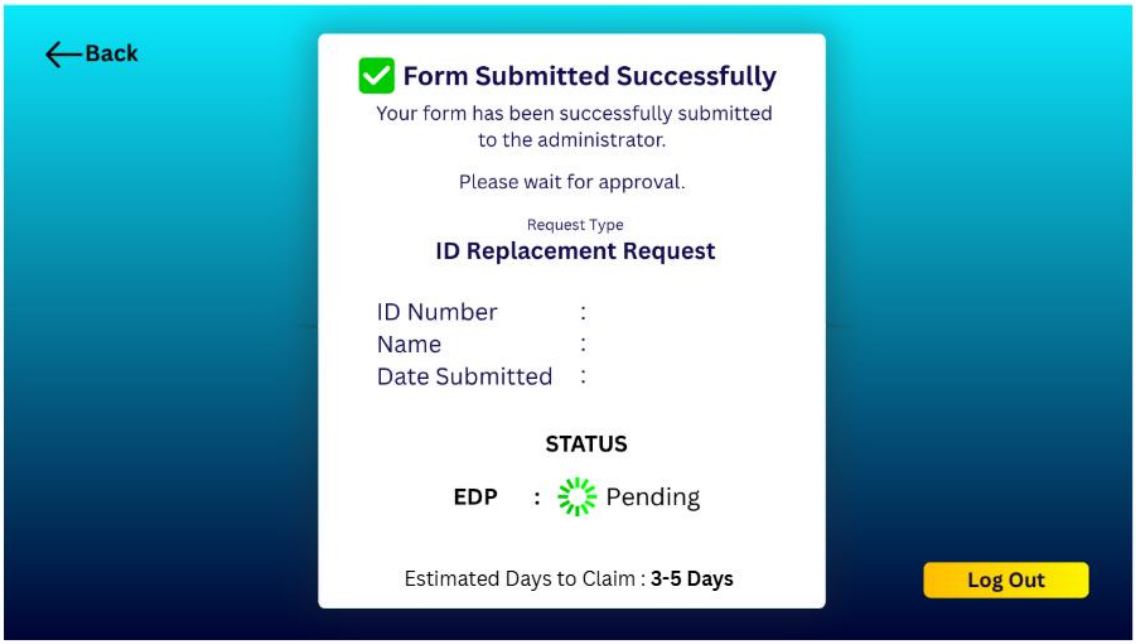

Figure 32. ID Replacement Request Status- Personnel/ Student User

Figure 32 shows that a successful request to the replace the ID has been submitted and is awaiting approval from the EDP department. The user must wait for the status to be updated before proceeding.

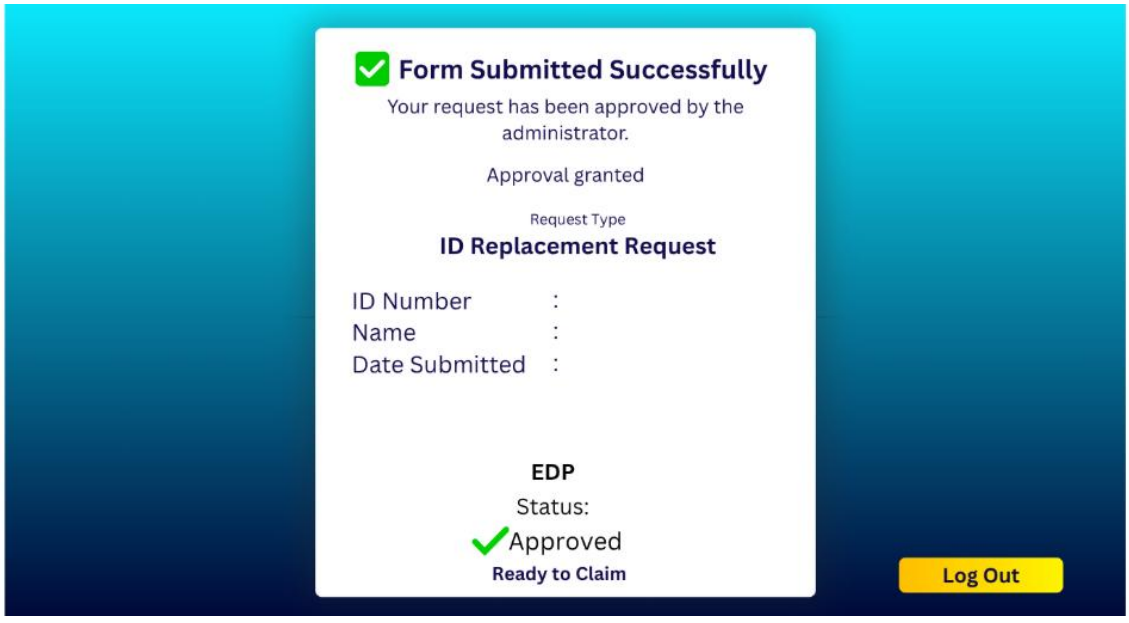

Figure 33. ID Replacement Request Status- Personnel/ Student User

Figure 33 depicts that the administrator and the EDP department have approved the ID replacement request. The status "Ready to Claim" indicates that the user can now proceed to receive the approved refund.

Figure 34. Document Request Form- Personnel/ Student User

Figure 34 shows the Saint Michael College of Caraga document request form. It captures basic details such as full name, mobile number, student ID, department, and a school official's email address to facilitate official document requests. Users choose the document type, mention its purpose, indicate the quantity of copies, and submit any

supporting files. There is a confirmation checkbox to ensure correctness before submission.

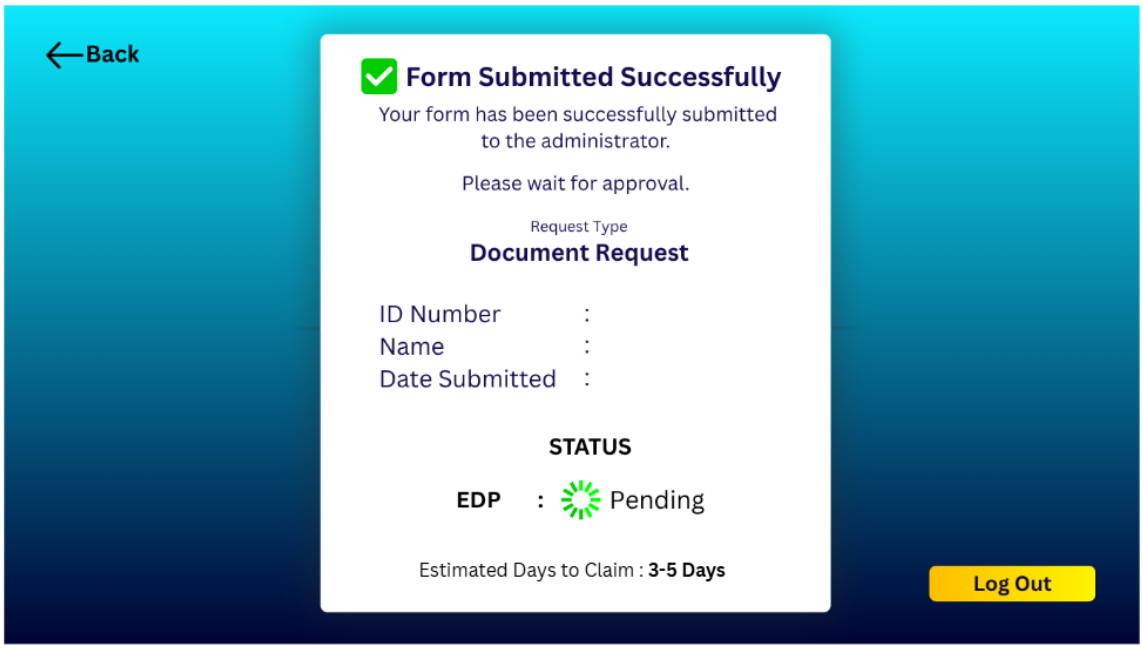

Figure 35. Document Request Status- Personnel/ Student User

Figure 35 shows that a document request form has been properly submitted to Saint Michael College of Caraga's administrator. The request type is "Document Request," and as of now, the status is Pending under the EDP department, meaning it's still awaiting approval.

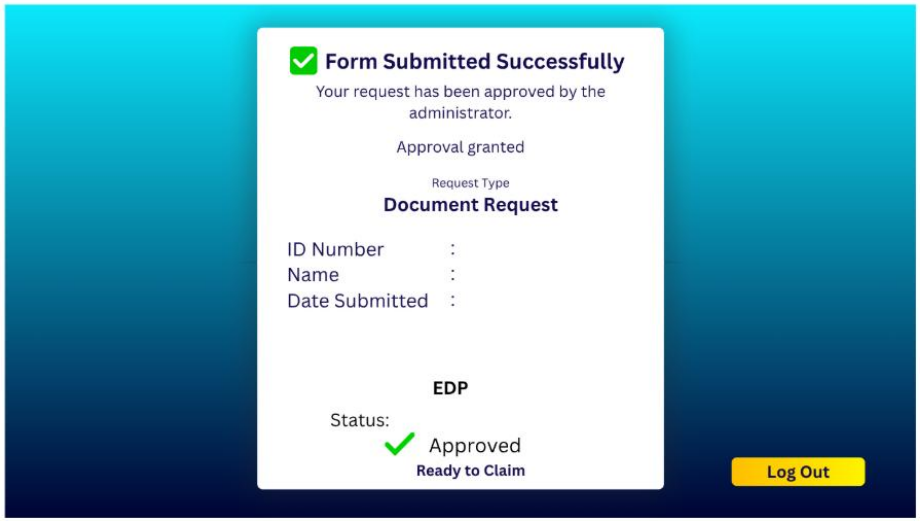

Figure 36. Document Request Status- Personnel/ Student User

Figure 36 shows that a document request submitted via Saint Michael College of Caraga's EDP system has been approved. The status "Ready to Claim" indicates that the user can now proceed to receive the approved refund.

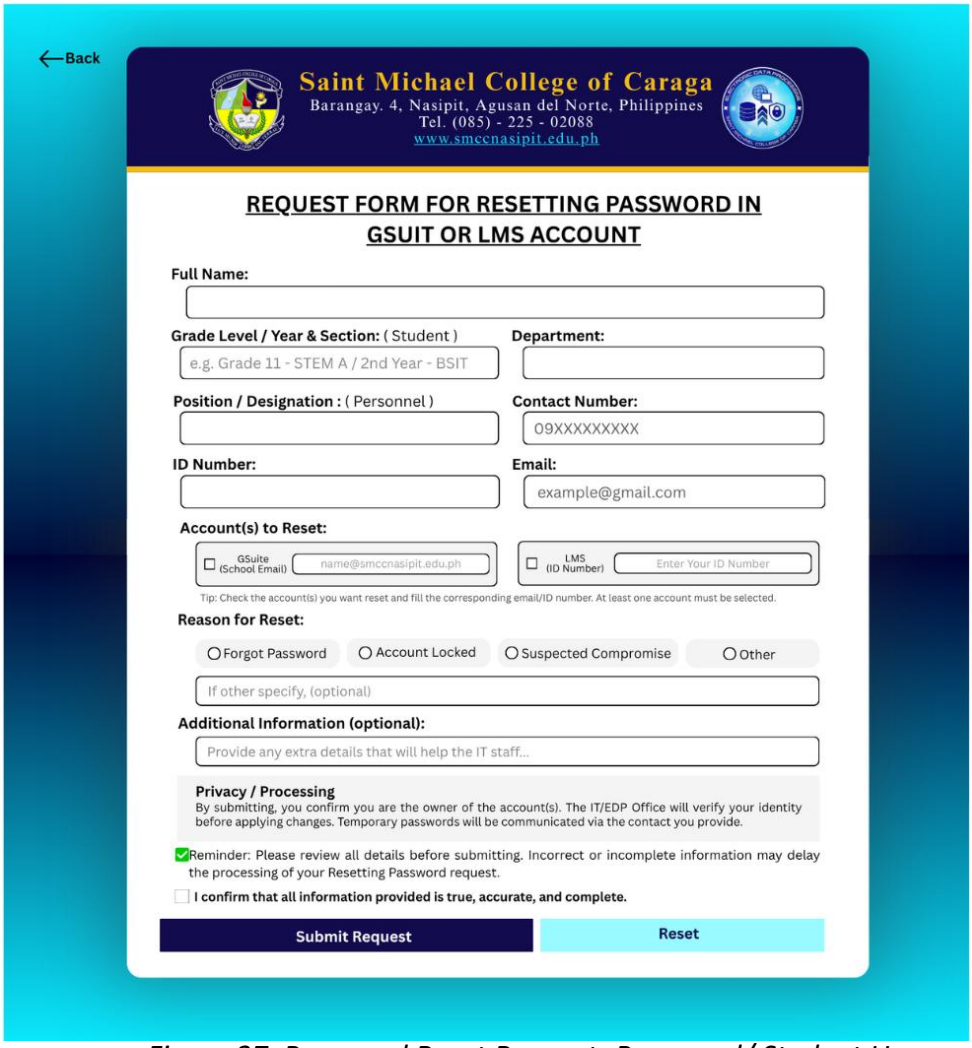

Figure 37. Password Reset Request- Personnel/ Student User

Figure 37 shows how to request a password reset for GSuite or LMS accounts. It gathers personal, academic, and contact information to authenticate the user's identity before processing the reset. It records account information, the reason for the reset, and user confirmation to secure processing by the EDP office.

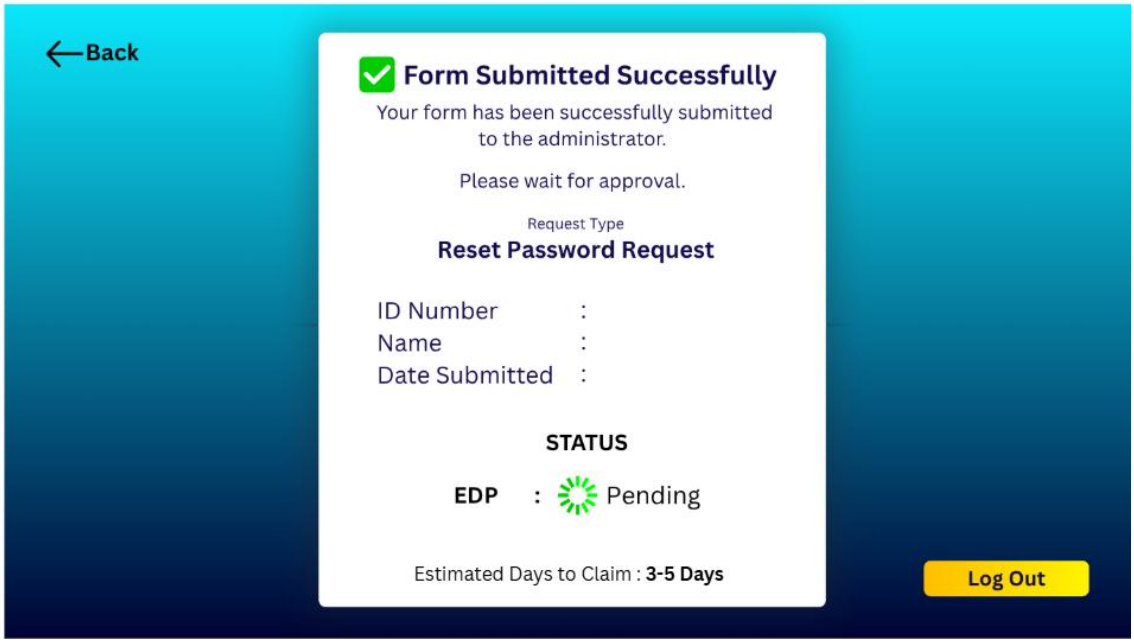

Figure 38. Password Reset Request Status- Personnel/ Student User

Figure 38 shows that the password reset request has been successfully sent and is pending approval from the EDP team. The status is marked "Pending," indicating the user can wait for a notification before proceeding.

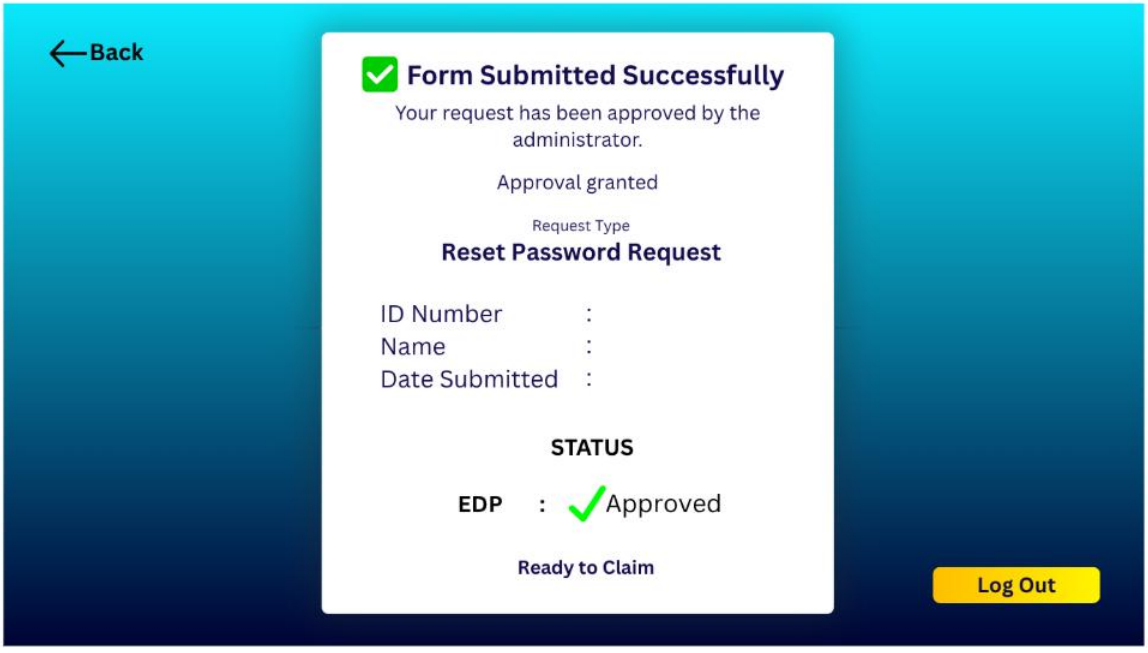

Figure 39. Password Reset Request Status-Personnel/ Student User

Figure 39 shows that the administrator has successfully approved a password reset request. The EDP system status shows "Approved," so the user can proceed to reset their password.

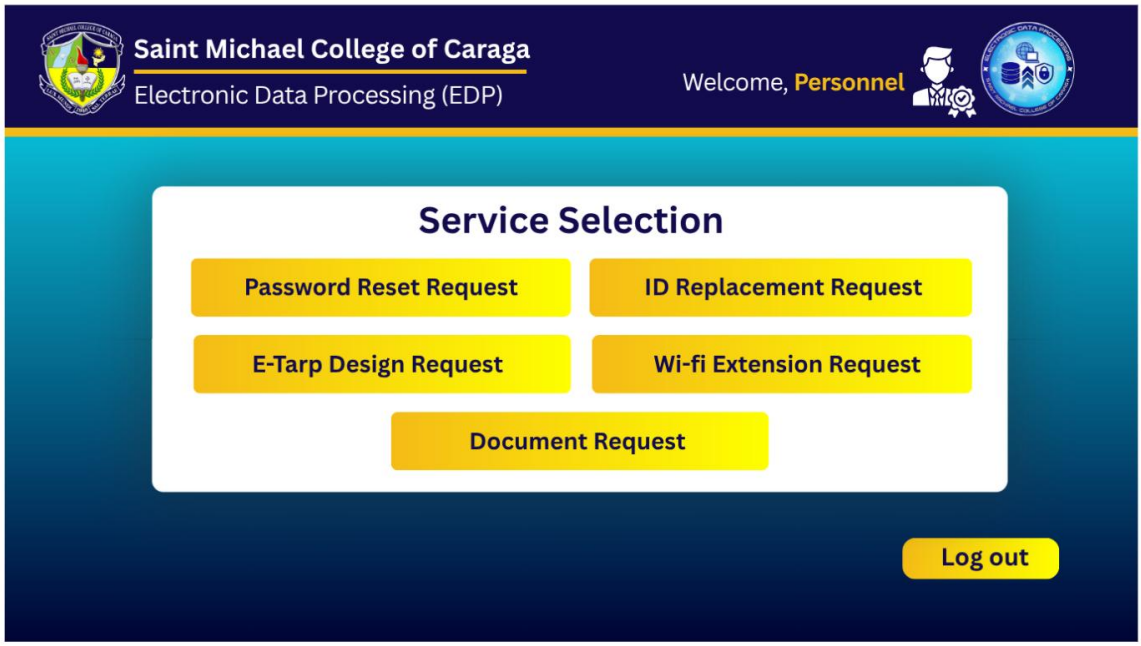

Figure 40. Service Selection- Personnel User

Figure 40 illustrates a digital portal service for SMCC EDP staff, providing convenient access to internal requests such as password resets, ID replacement, and document services.

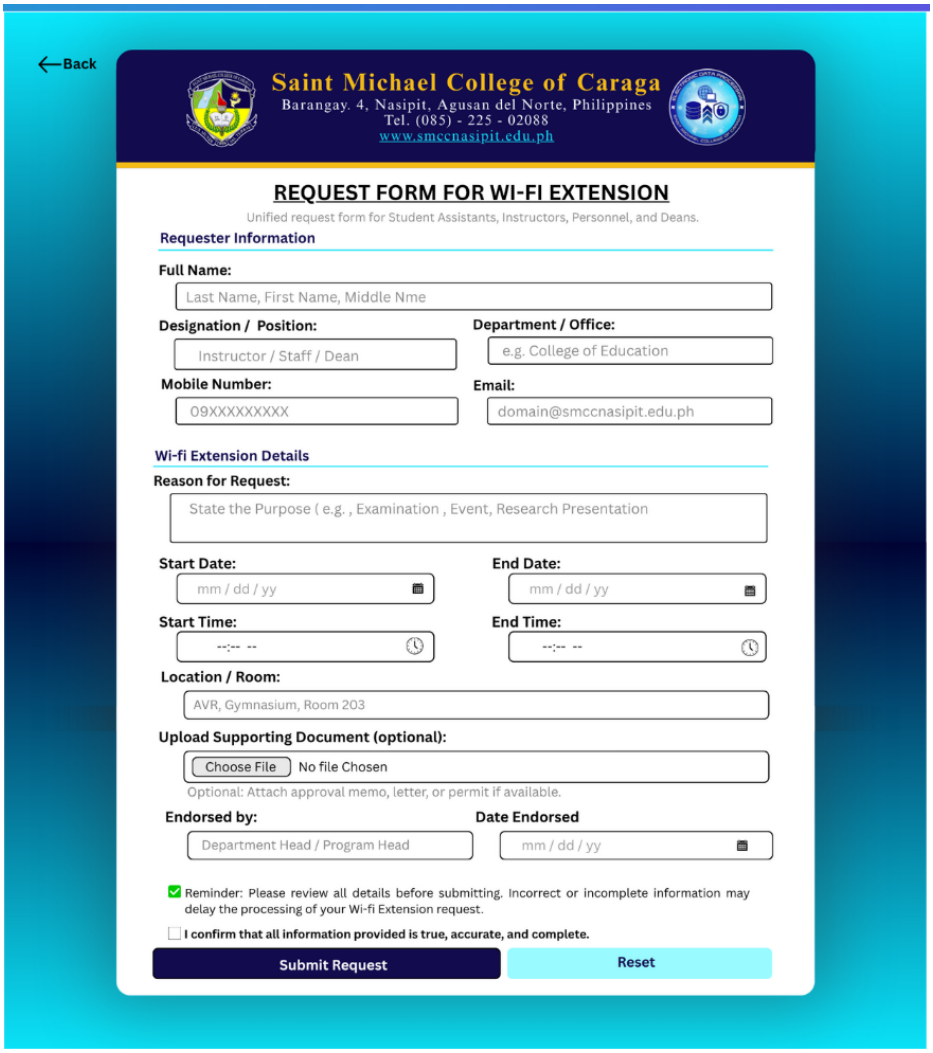

Figure 41. Request Form for Wi-Fi Extension- Personnel User

Figure 41 shows SMCC's Wi-Fi Extension Request Form, intended for staff to submit detailed extension requests for academic or institutional use. It captures the requester's identity, purpose, schedule, and location, along with an endorsement and declaration section to provide accountability.

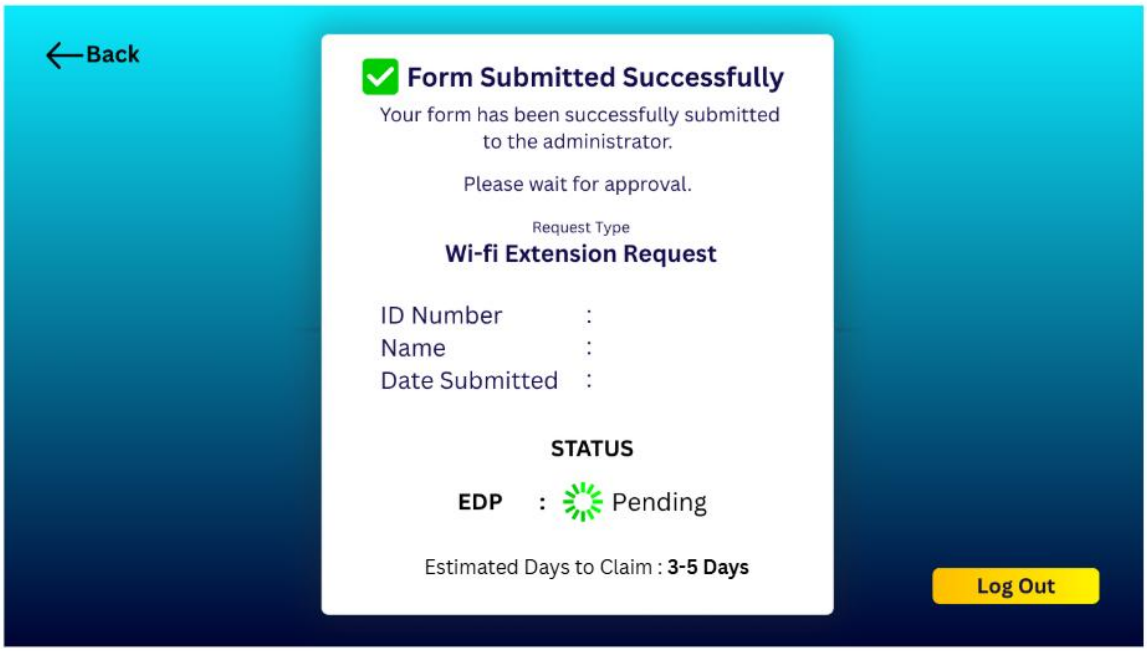

Figure 42. Wi-Fi Extension Request Status- Personnel User

Figure 42 shows the submission of a Wi-Fi Extension Request at SMCC, with a pending status and awaiting administrator approval. It assures transparency and user confidence by presenting a clear overview of the requested information.

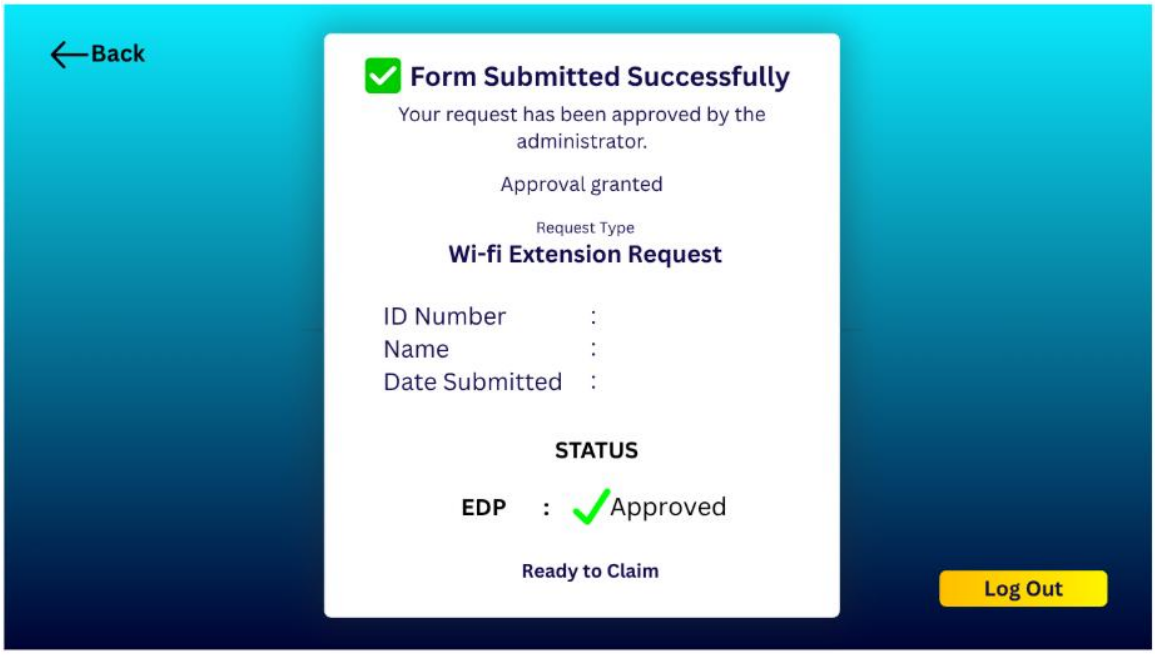

Figure 43. W-Fi Extension Request Status- Personnel User

Figure 43 shows that an administrator has approved a Wi-Fi Extension Request at SMCC, and the installation now available. It identifies a successful electronic workflow from submission to authorization in the EDP system.

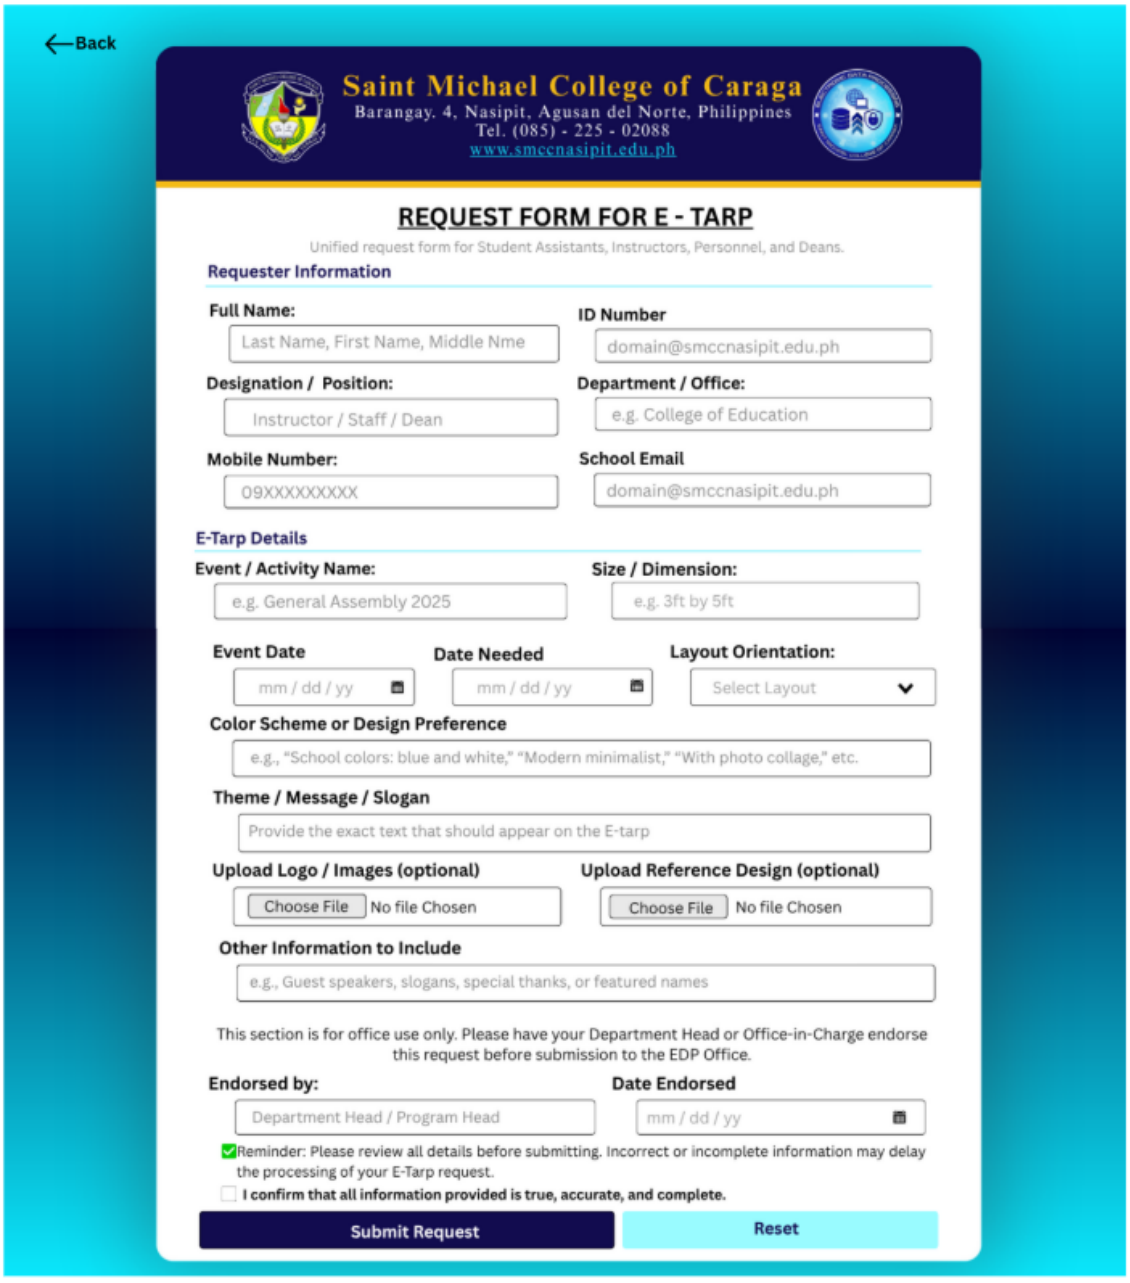

Figure 45. Request Form for E-Tarp- Personnel User

Figure 45 shows SMCC's E-TARP Request Form, which allows users to send formal design specifications for institutional event tarpaulins. It captures requester identity, event information, and aesthetic preferences, with a certification clause that guarantees accuracy and compliance approval requirements.

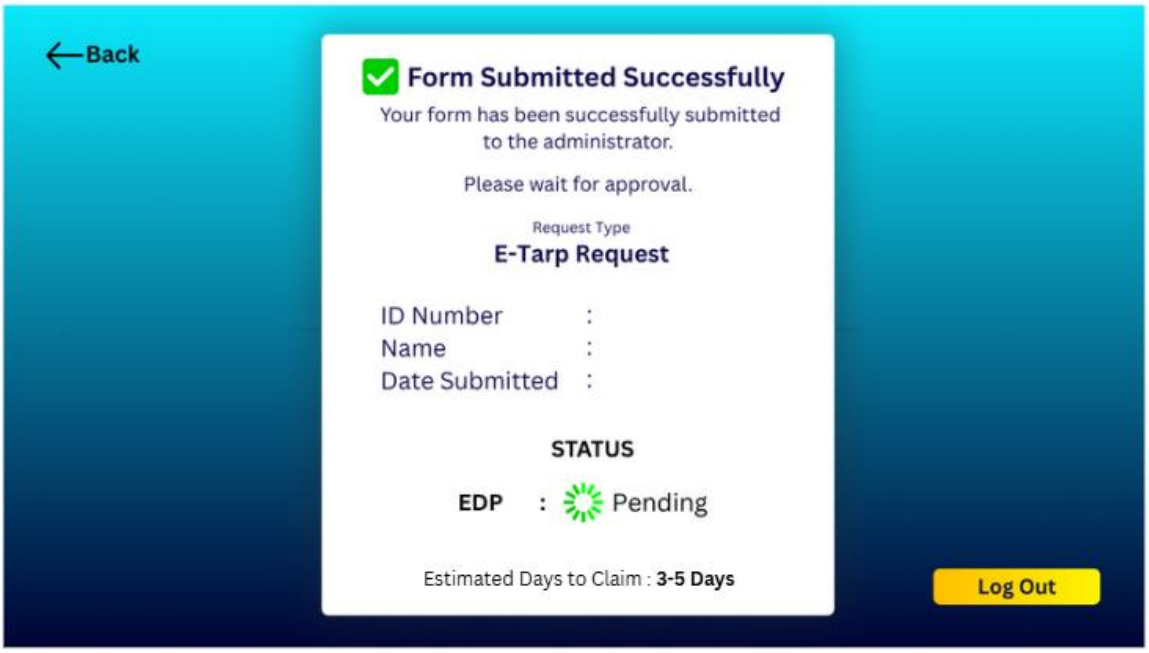

Figure 46. Request Status for E-Tarp - Personnel User

Figure 46 shows the successful submission of an E-TARP Request by SMCC, with the status pending and awaiting administrative approval. It demonstrates a well-defined digital workflow for institutional design requests within the EDP system.

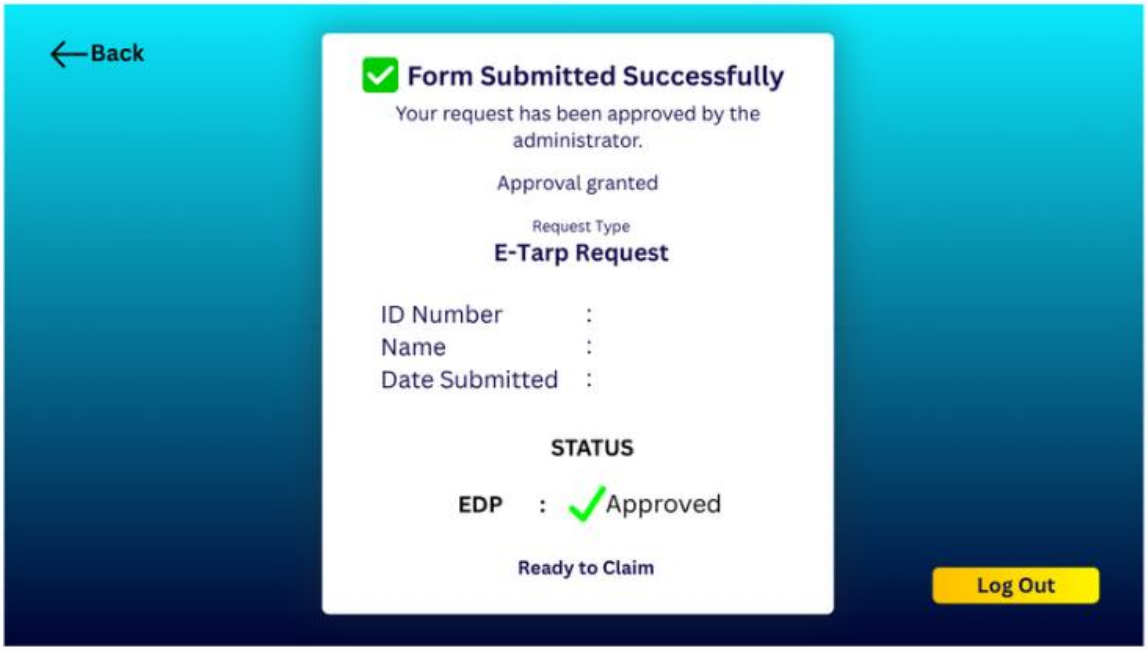

Figure 47. Request Status for E-Tarp - Personnel User

Figure 47 shows that an E-TARP Request by SMCC has been approved and is ready for claiming. It signifies completion of the digital request process, providing transparency and efficiency in institutional design services.

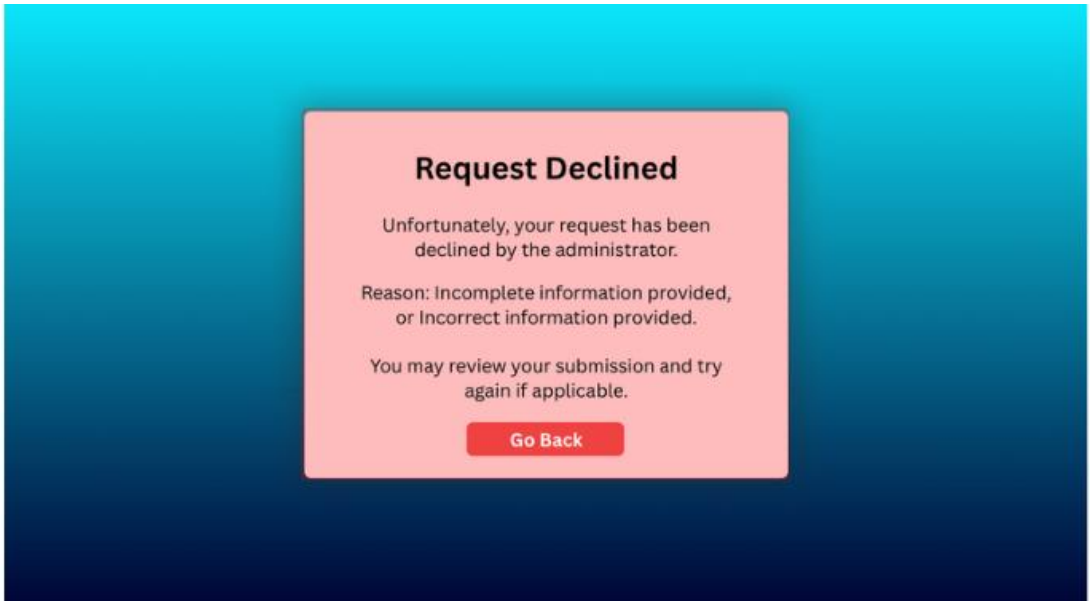

Figure 48. Request Decline Notification – Personnel/ Student User

Figure 48 shows the notification screen shows that the request has been declined by the administrator, due to incomplete or incorrect information in the submission. A red button labeled "Go Back" allows the user to go back and review or correct their request, if applicable. This interface ensures clear communication of submission status and encourages proper resubmission.

Admin

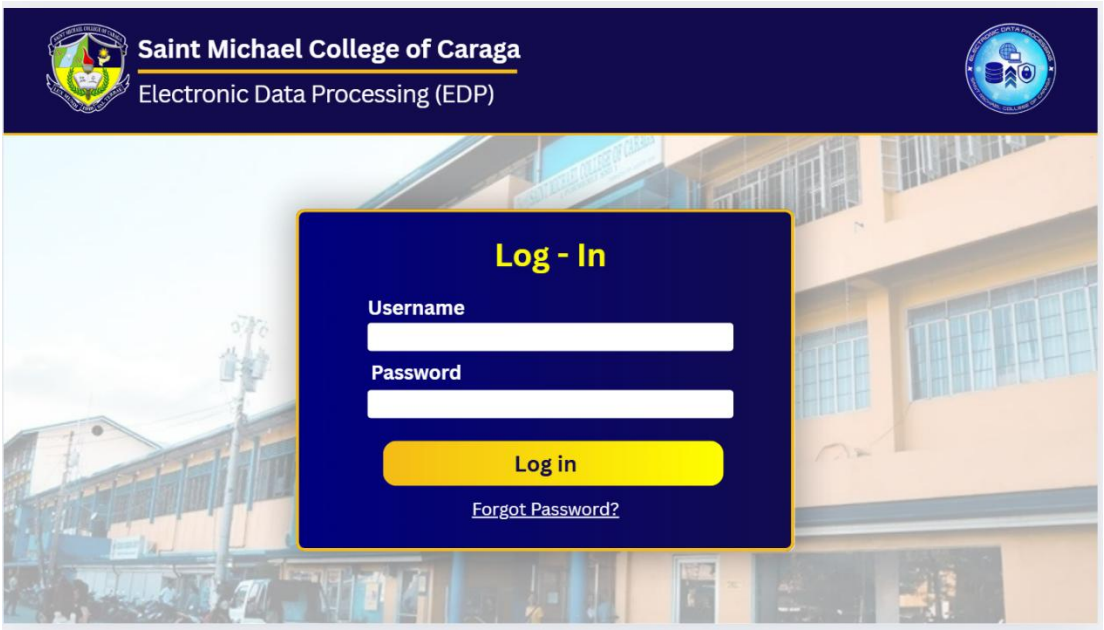

Figure 49. Admin Login -Super Admin/Admin

Figure 49 displays the login page of Saint Michael College of Caraga's Electronic Data Processing (EDP) system, with fields for username and password, a login button, and a "Forgot Password?" link. It is the point of entry for users getting access to academic and administrative digital services.

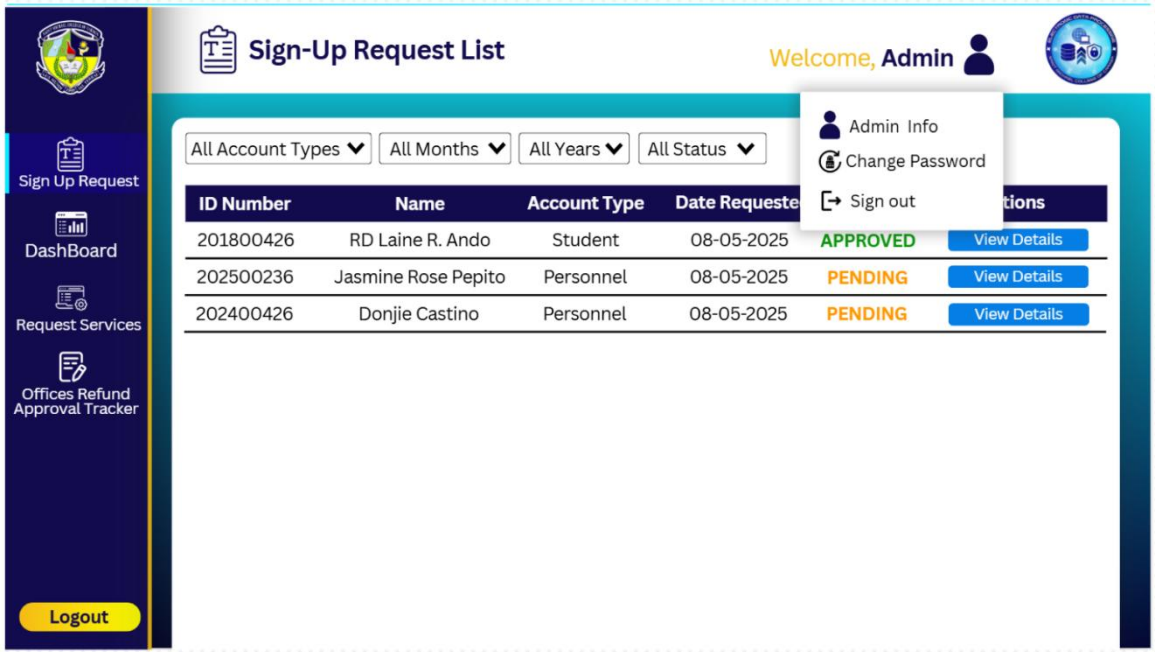

Figure 50. Admin Profile - Super Admin

Figure 50 shows that the admin drop box under the admin icon provides quick access to account options: Admin Info, Change Password, and Sign out. It serves as a compact menu for managing admin credentials and session control.

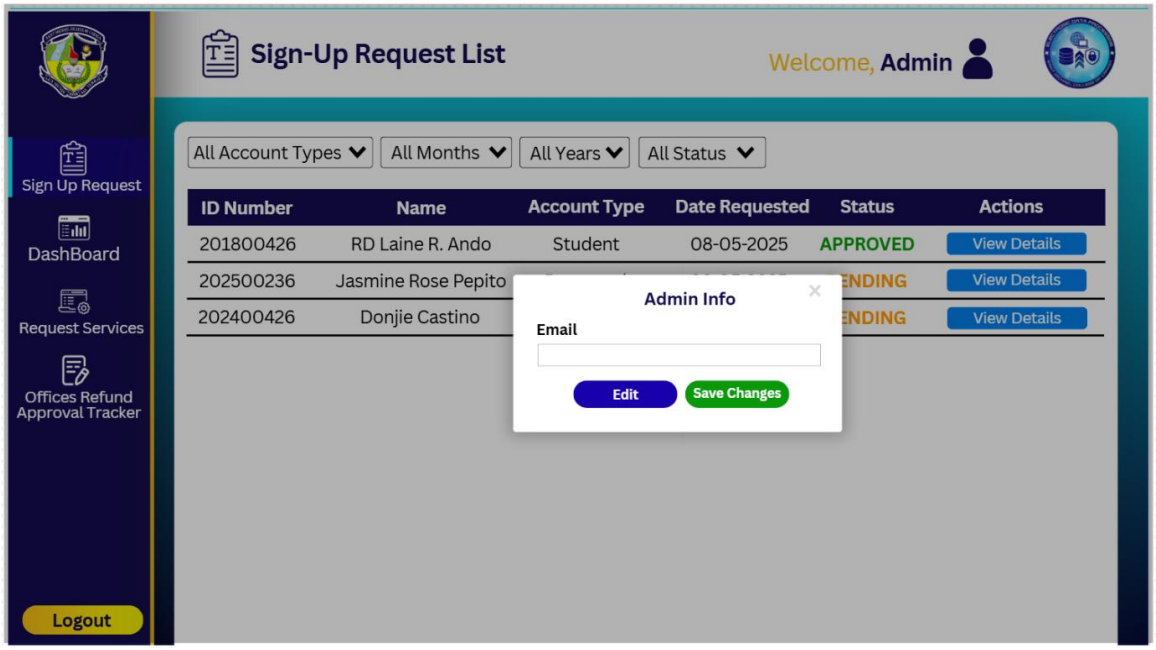

Figure 51. Admin Info - Super Admin/Admin

Figure 51 shows Admin Info, which allows the administrator to view and edit their email. It includes two buttons: Edit (blue) and Save Changes (green), enabling updates to contact details.

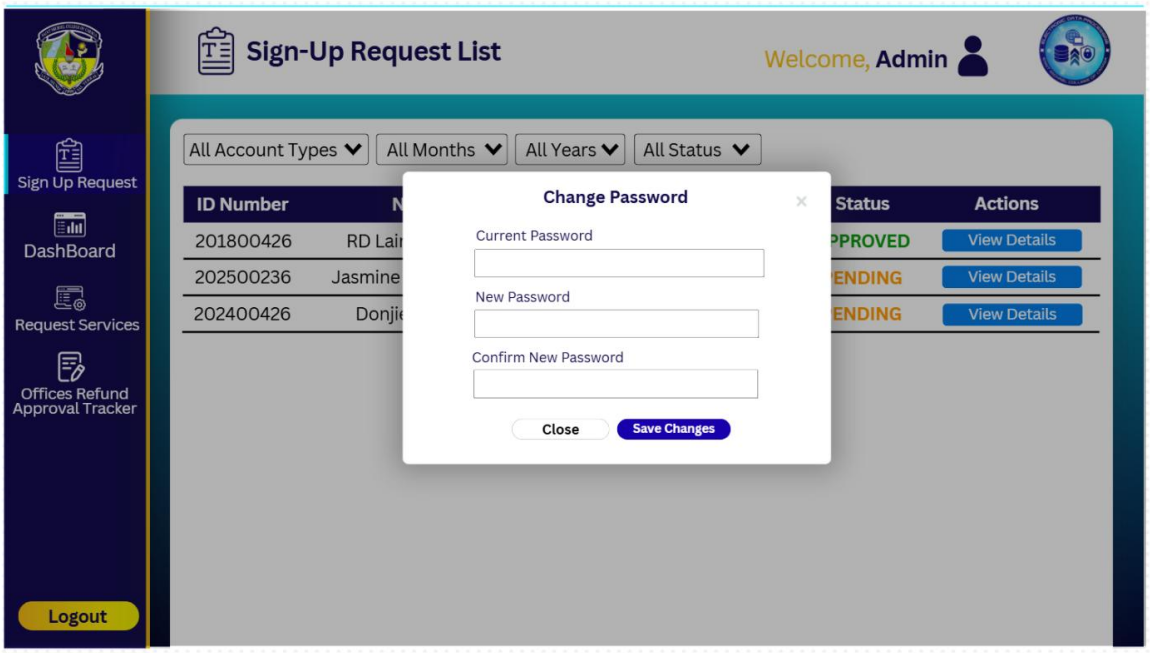

Figure 52. Change Password -Super Admin/Admin

Figure 52 displays the Change Password, which allows the admin to update their login credentials by entering the current password, a new password, and confirming it. It includes Close and Save Changes buttons to cancel or apply the update.

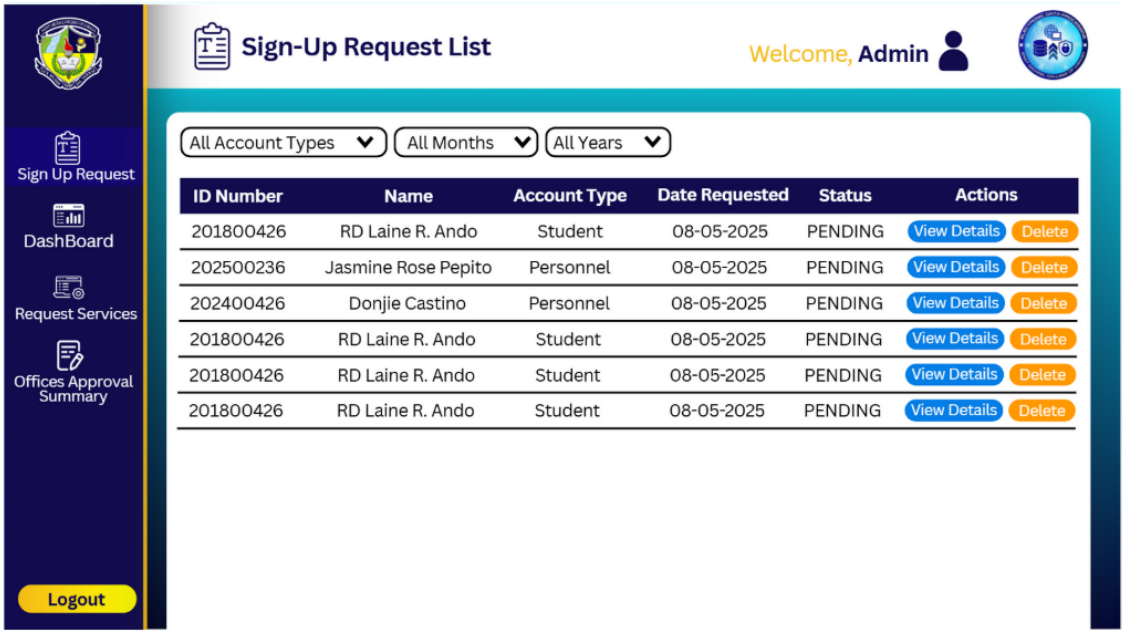

Figure 53. Sign-Up Request List - Super Admin

Figure 53 displays the admin dashboard of pending student sign-up requests for the EDP system with buttons to filter by account type, month, and year. Each record has user information and action buttons for viewing or deleting requests.

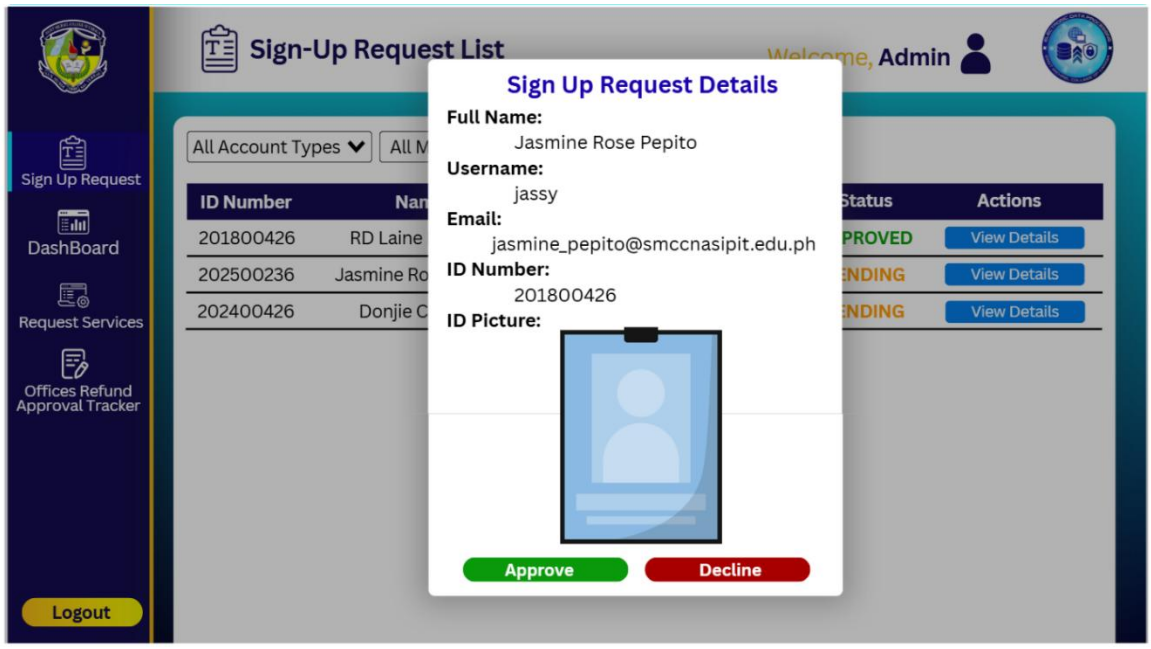

Figure 54. View ID Request -Super Admin

Figure 54 shows a pop-up window displaying detailed user information, with buttons to approve or decline the request. This setup streamlines account approval workflows for administrators.

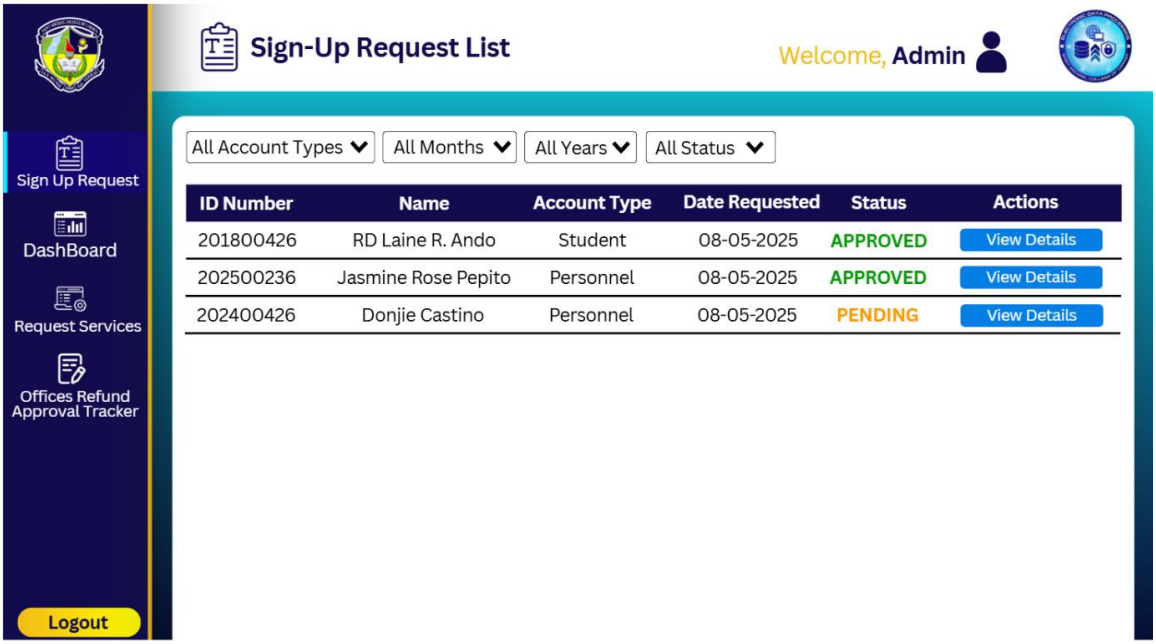

Figure 55. Approved Request -Super Admin

Figure 55 shows a list of sign-up requests, mostly marked as PENDING, with one entry marked as APPROVED, indicating that the admin has begun processing requests. This status overview helps track which accounts still need action and which have been accepted.

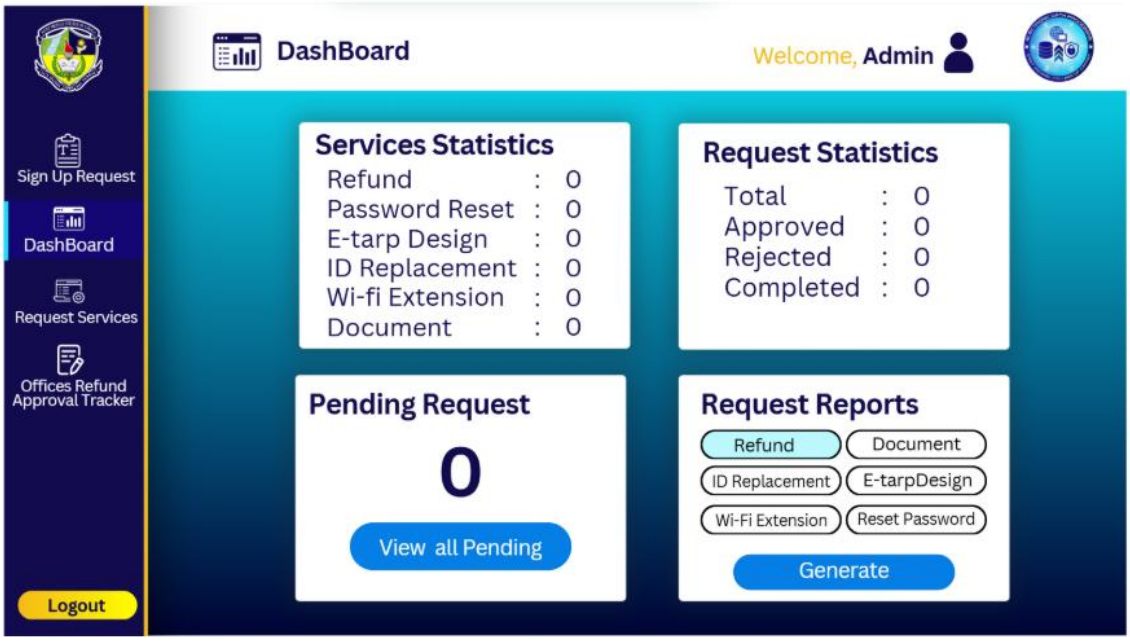

Figure 56. Dashboard -Super Admin

Figure 56 displays the admin overview dashboard for handling service requests with zero activity across all categories, such as refunds, password resets, and document requests. It has quick views of pending requests and the ability to generate a report on monitoring system usage.

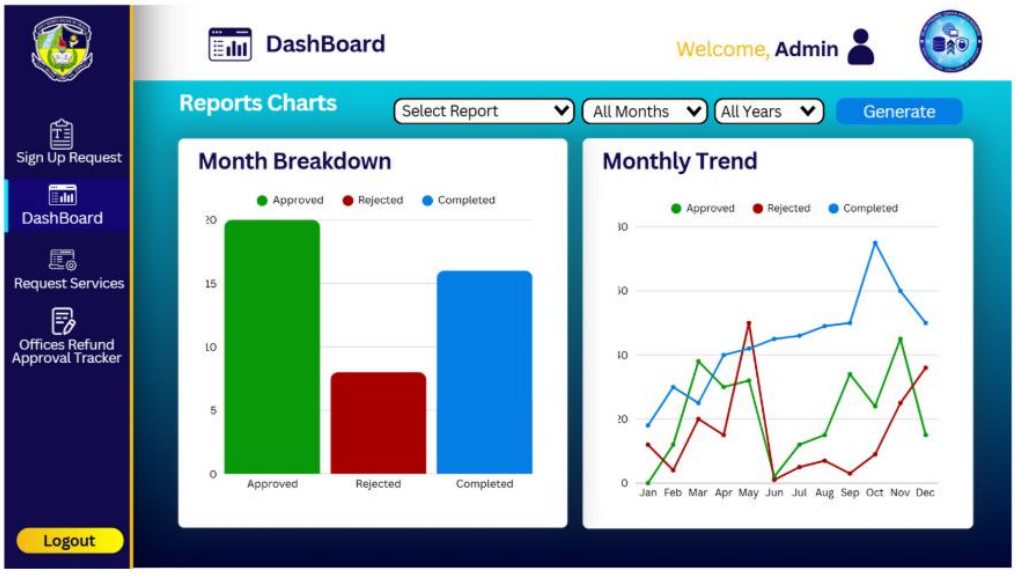

Figure 57. Dashboard Refund Report -Super Admin

Figure 57 shows the dashboard continuation, which visualizes report data through bar and line charts, showing monthly breakdowns and trends for Approved, Rejected, and Completed requests. Approved reports lead in volume, while completed ones are the lowest. Filters and a generate button allow admins to customize the view by report type, month, and year.

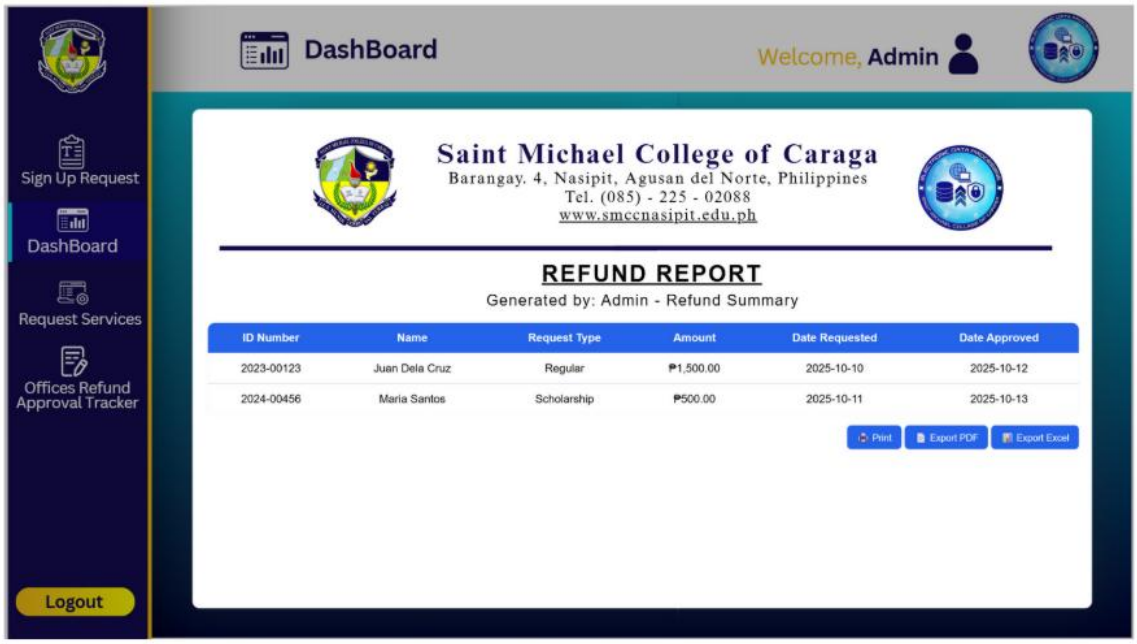

Figure 58. Dashboard Refund Report -Super Admin

Figure 58 shows the refund report displays approved refund requests, including request numbers, names, types, amounts, and approval dates. It helps the admin track processed refunds and export the data for documentation. This view is generated after selecting "Refund" and clicking the "Generate" button.

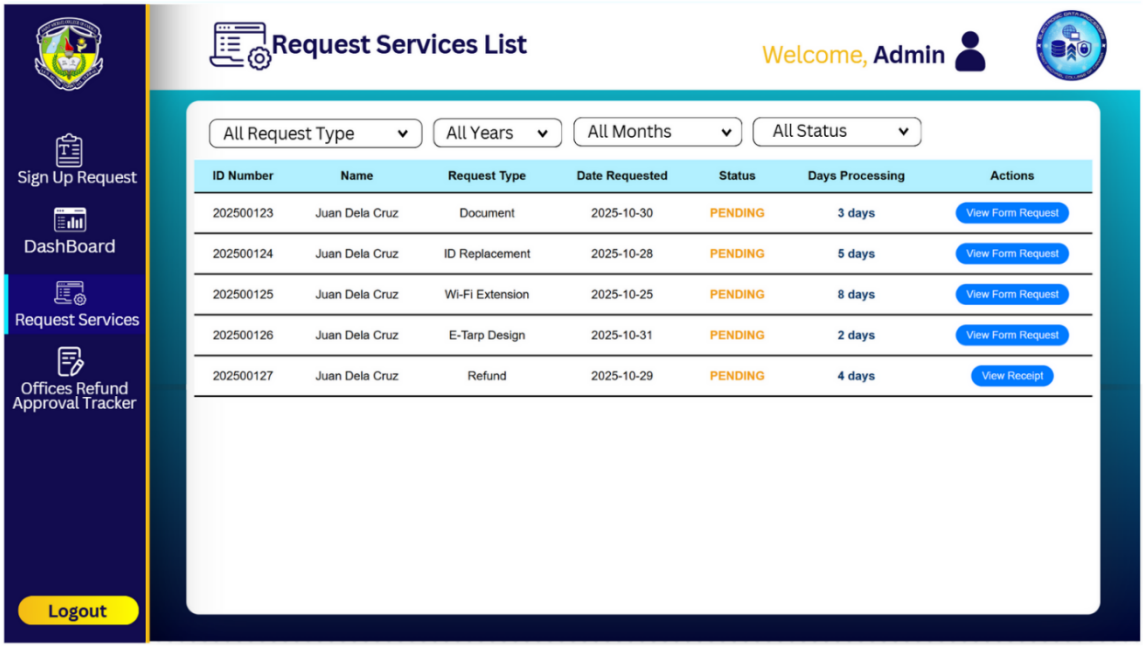

Figure 59. Request Services List -Super Admin

Figure 59 shows the request services List, which displays multiple service requests from Juan Dela Cruz, all marked as PENDING, including document, ID replacement, Wi-Fi extension, and more. Each entry the includes request type, date, and action buttons to view or delete the entry. Filters at the top allow the admin to sort requests by type, month, and year.

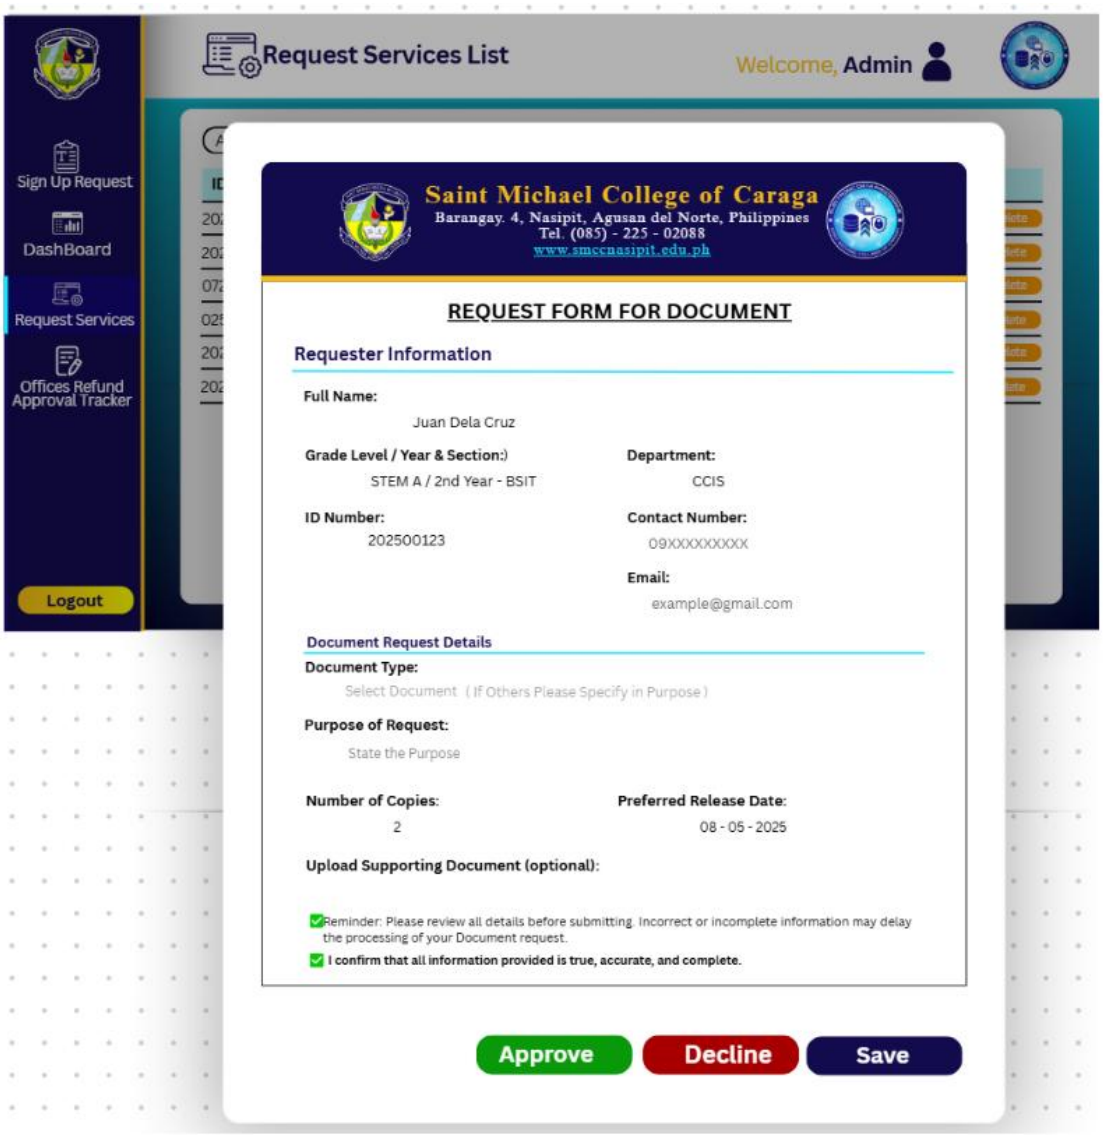

Figure 60. View Form Request -Super Admin

Figure 60 shows a completed document request form with fields for requester details, purpose, document type, quantity, and preferred release date. It includes options for uploading supporting files and buttons for the admin to approve, decline, or save the request.

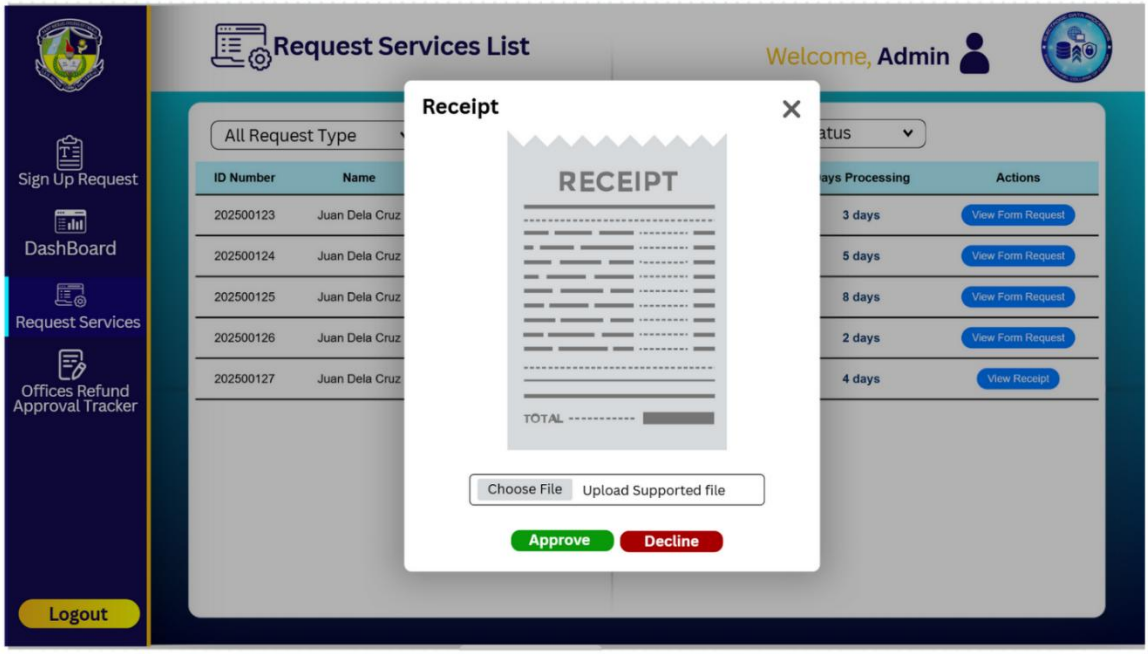

Figure 61. View Receipt -Super Admin

Figure 61 displays a list of refund service requests with action buttons to view the form, view the receipt, or delete the entry. A receipt pop-up appears for review, showing itemized details and the total amount. It allows administrators to upload supporting files using **"Choose File"** button. Admins can approve or decline the refund directly from this view.

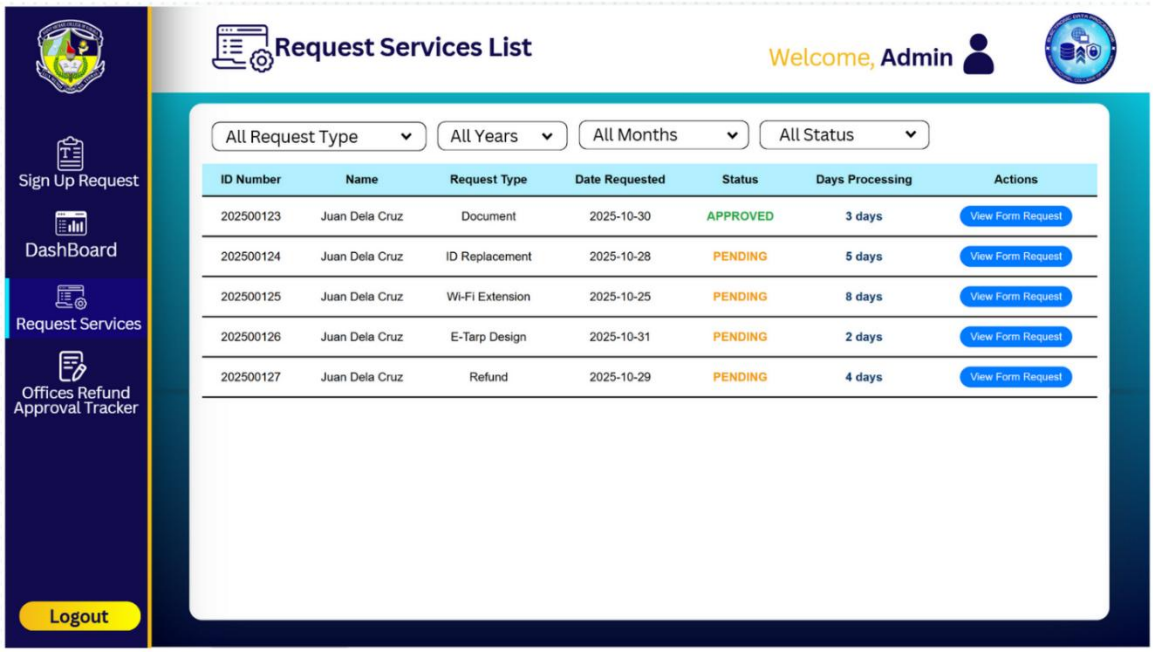

Figure 62. Request Services List -Super Admin

Figure 62 shows where the View Receipt button has changed to View Form Request after receipt approval for the refund request. This indicates the admin has completed the initial validation step and can now proceed to review the complete request form. The status remains pending, awaiting final approval or action.

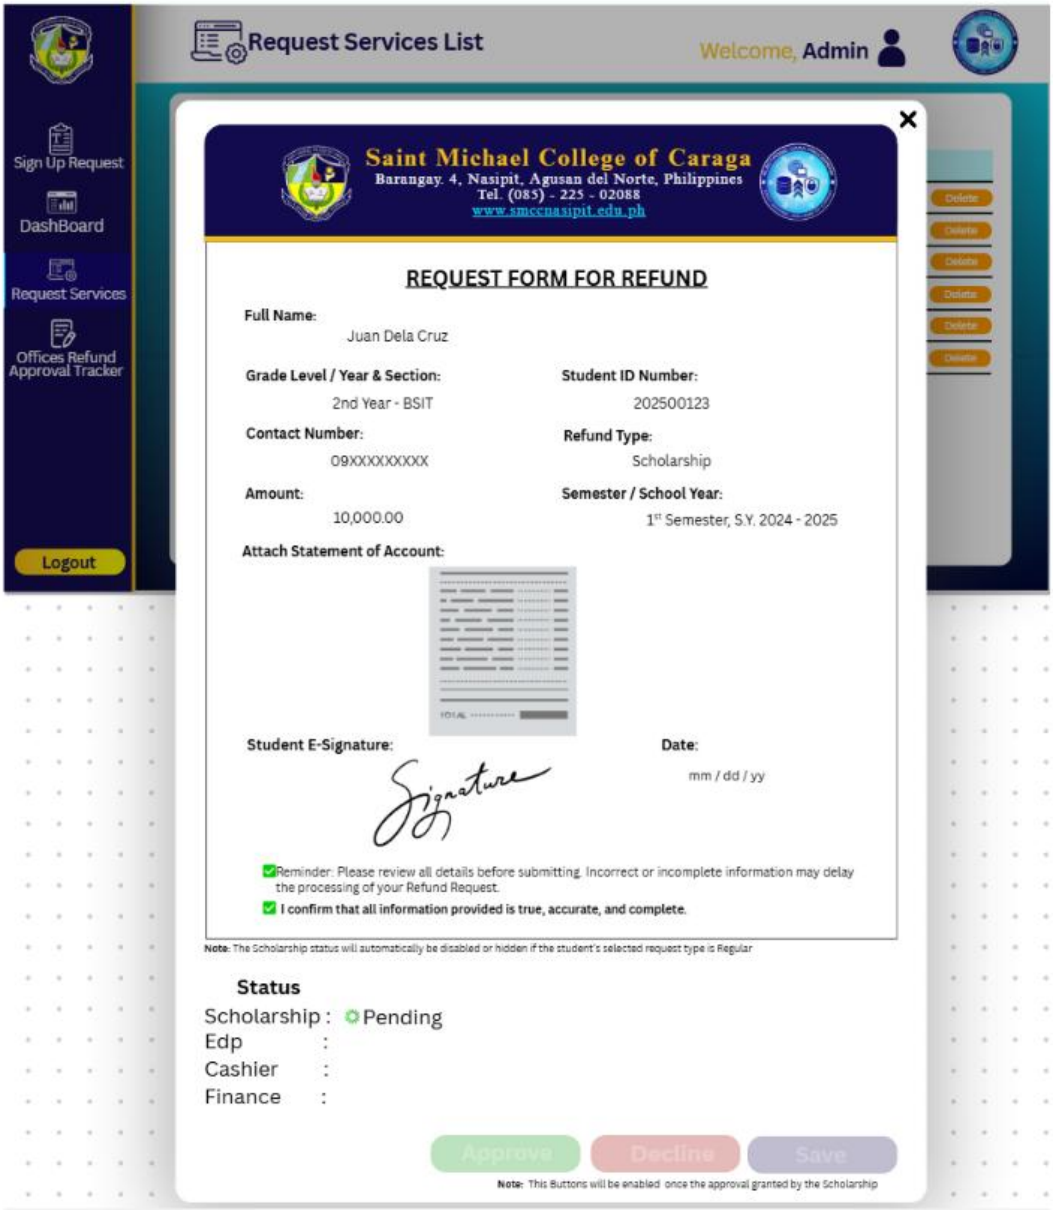

Figure 63. View Request form -Super Admin

Figure 63 displays a completed refund request form with attached statement of account and e-signature. Status indicators indicate the request is pending at the Scholarship level, with other approvals pending. Admin options include approving, declining, or saving the request; these actions were enabled Scholarships approved the Request.

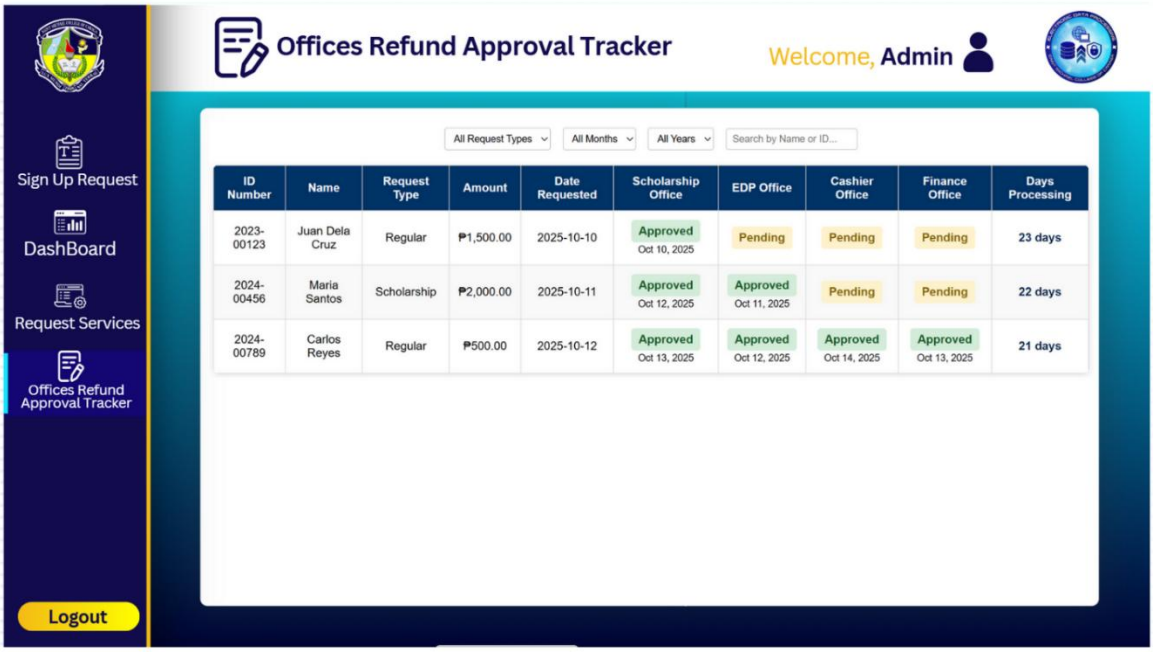

Figure 64. Offices Refund Approval Tracker -Super Admin

Figure 64 shows the Offices Refund Approval Tracker interface gives administrators the ability to track student refund requests as they flow through different offices. Each entry in the table includes request number, student name, request type, amount, and date filed. It also monitors the approval status from four offices—Scholarship, EDP, Cashier, and Finance—through color-coded indicators: green for Approved, yellow for Pending, and gray for Not Yet Approved. The Days Process column

shows how long each request has been in progress, helping staff to focus and manage workflows efficiently.

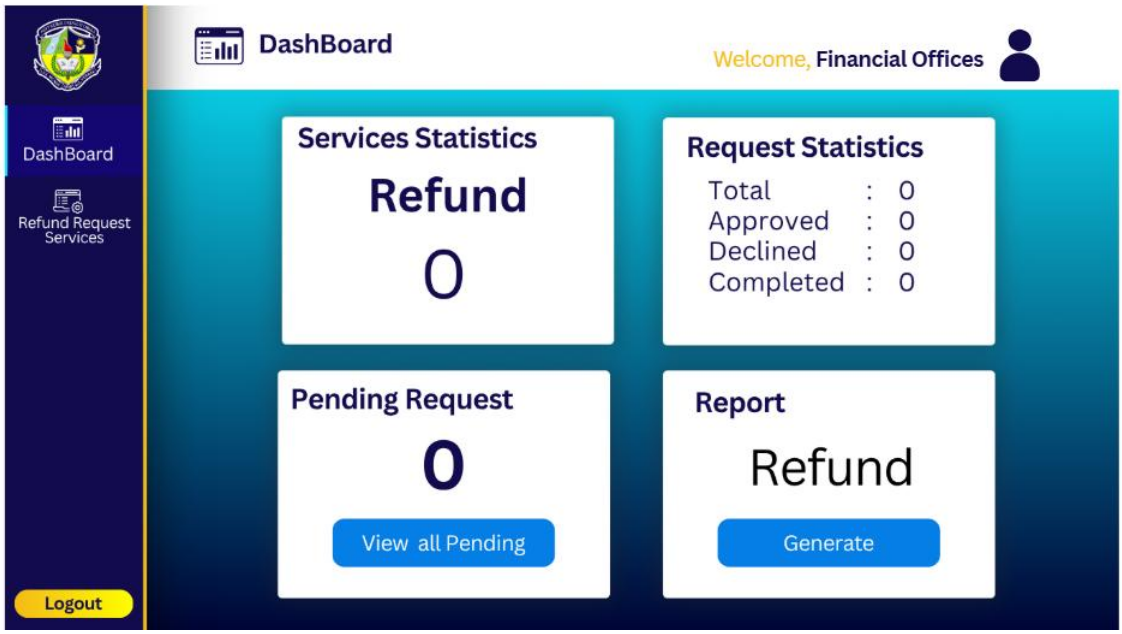

Figure 65. Dashboard- Admin Offices

Figure 65 shows a breakdown of refund request statistics across three offices: Scholarship, Cashier, and Finance. All three have access to view service counts, request statuses, pending actions, and reporting tools. While the interface currently displays "Welcome, Scholarship," the data and functions are intended for cross-office coordination.

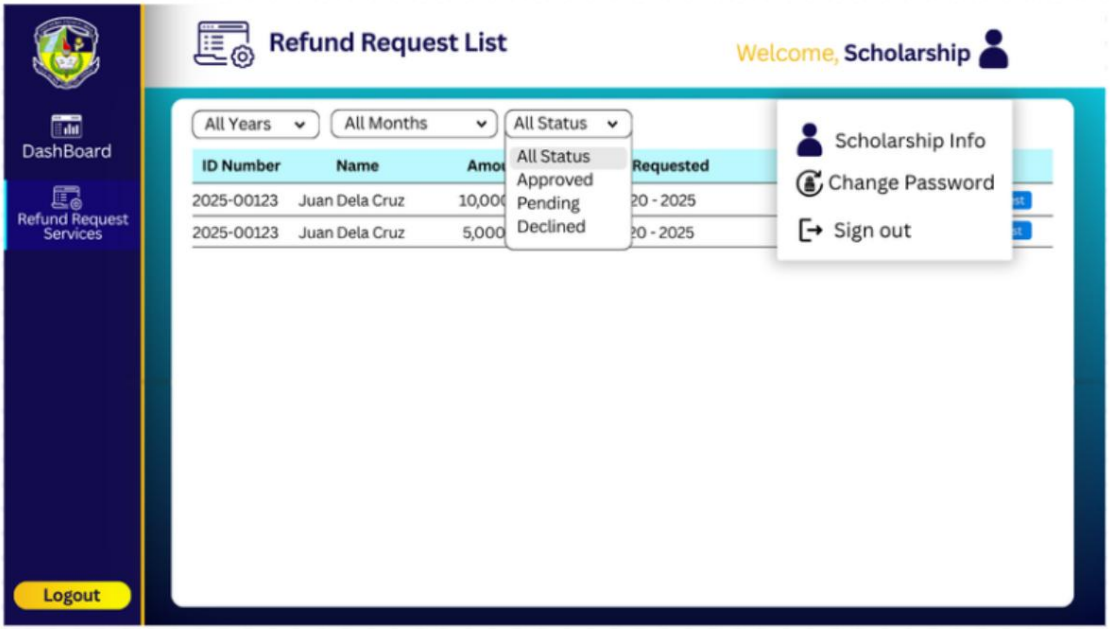

Figure 66. Request Services List - Admin Offices

Figure 66 displays the refund request list accessible by the Scholarship, Cashier, and Finance offices. It shows individual entries with status indicators—one approved and one pending—alongside action buttons to view or delete each form. The shared access ensures coordinated tracking and processing across departments. Dropdown filters for year, month, and status—such as Approved, Pending, or Declined—enable targeted viewing of requests. The system supports efficient tracking and decision-making for financial aid processing.

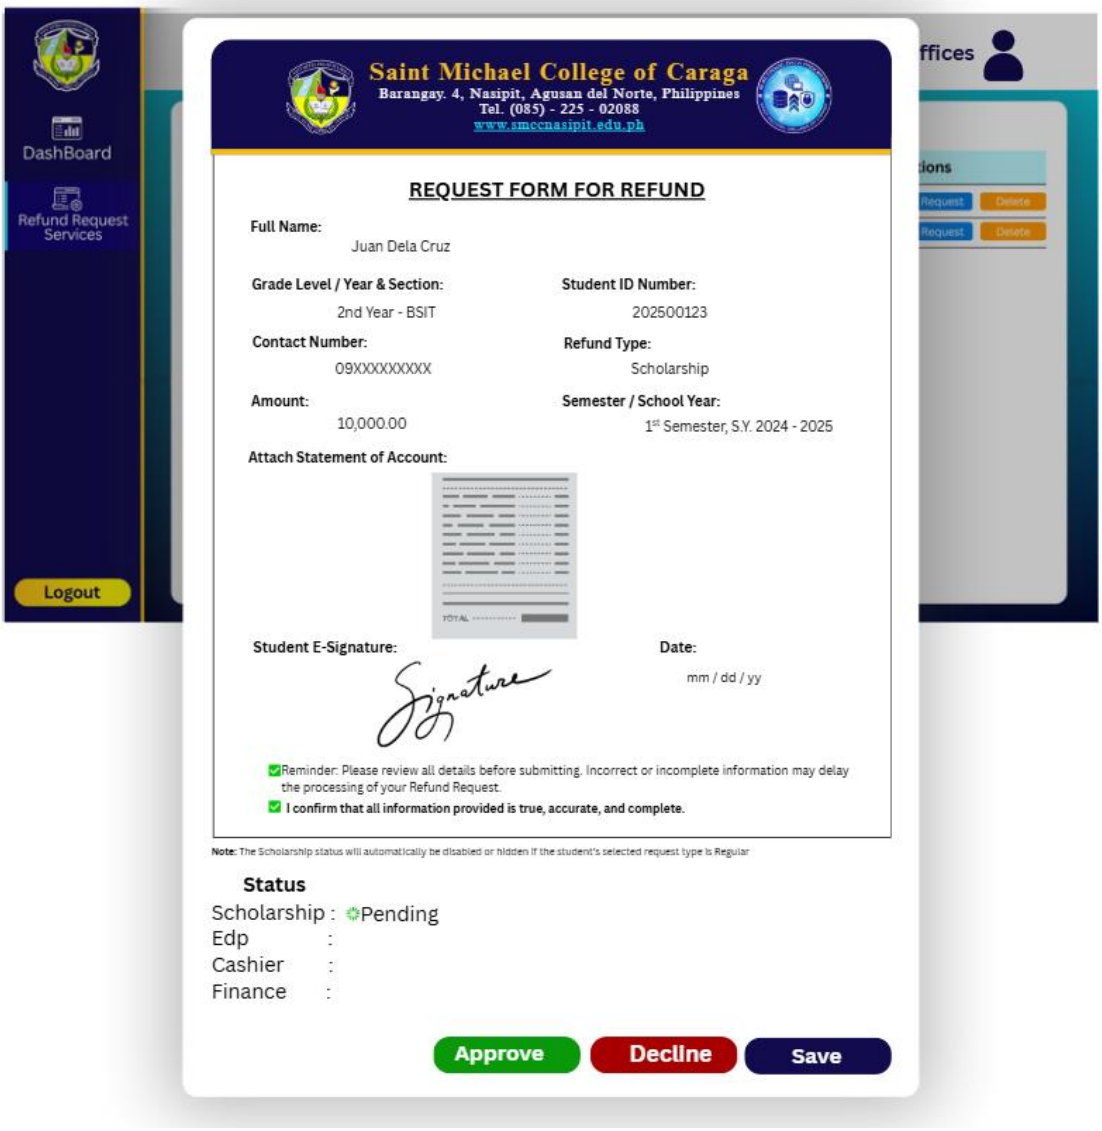

Figure 67. View Form Request - Admin Offices

Figure 67 shows that the refund request form is shared across the Scholarship, EDP, Cashier, and Finance offices, with each office having access to review and act on requests. Action buttons (Approve, Decline, Save) are only enabled sequentially; an office can proceed only after the previous office has marked its status as "Approved." For example, if EDP is still pending, the Scholarship cannot take action until EDP completes its approval. This ensures a controlled, step-by-step validation process across all offices.

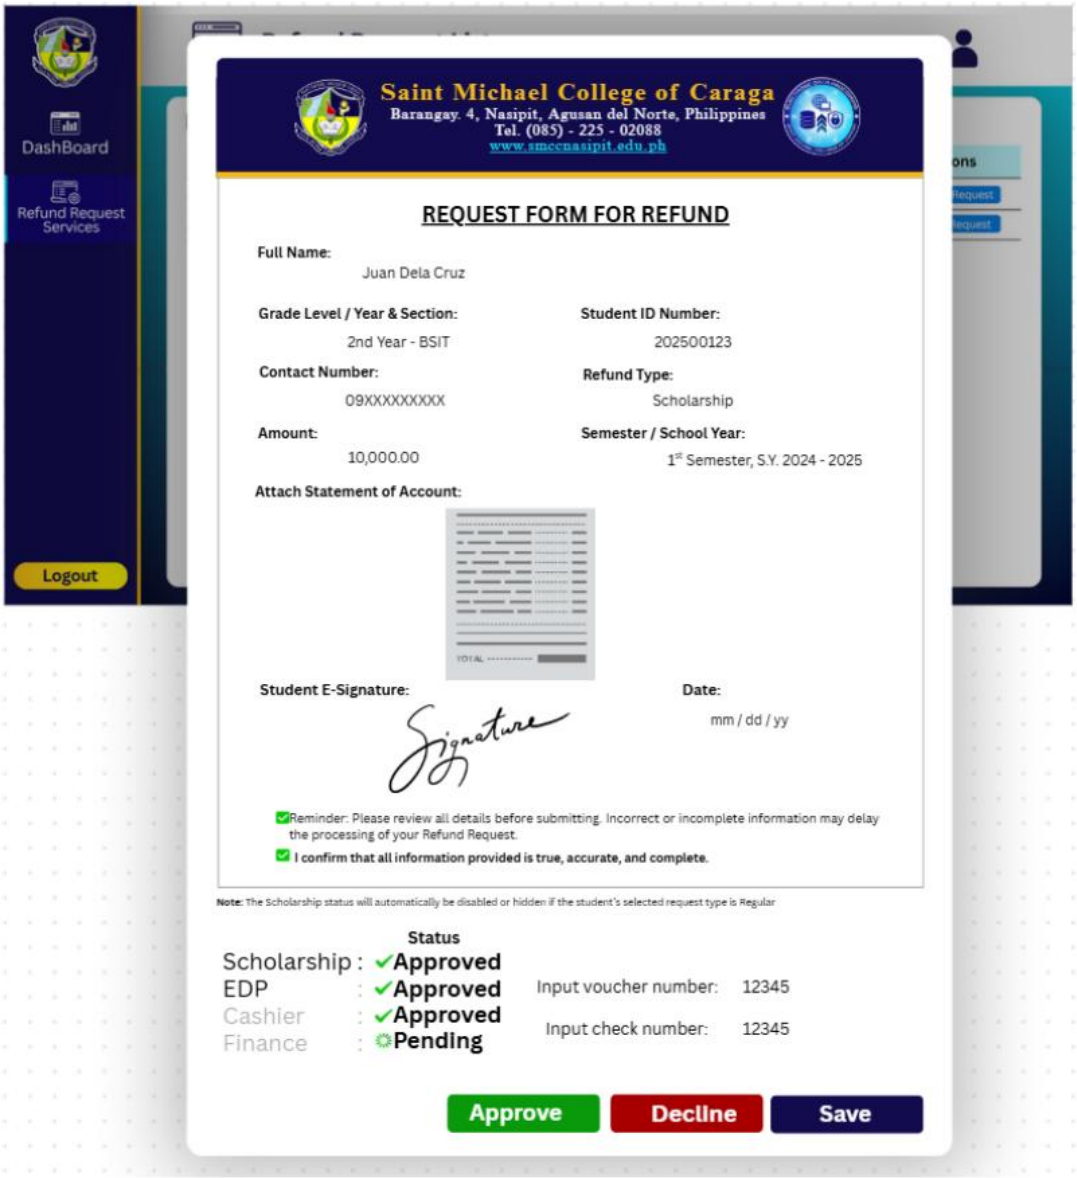

Figure 68. View Form Request - Admin Offices

Figure 68 shows the refund request form, viewed from the Finance office interface, which follows the same sequential approval logic as the previous stages. Once the Scholarship, EDP, and Cashier offices have approved the request, the Finance office gains access to the action buttons. The voucher number and check number—entered by the Cashier—is visible but locked for editing, ensuring other offices can verify it without making changes. This preserves data integrity while allowing final validations.

2.10 Software Platforms, Development Environments, and Tools

Table 1

Components	Specification	Usage
Internet Browser	Chrome	A web browser allows users to display and access content on the internet. Here, it is used to open the Integrated Service Portal for Electronic Data Processing at Saint Michael College of Caraga. The browser opens the portal's web-based interface, which users can access to securely log in and use its functionalities.
Front-End	HTML	Defines the structural layout of the system's interface, arranging elements such as forms, text, and multimedia components.

	CSS	Enhances the visual appearance of the HTML structure, ensuring a more attractive, engaging, and responsive user interface.
	JavaScript	Provides interactivity and client-side functionality, enabling dynamic content updates and responsive behaviors.
	Bootstrap	A front-end framework that facilitates the creation of responsive and mobile-first web pages using pre-designed components, grids, and utility classes.
	jQuery	A JavaScript library that simplifies DOM manipulation, event handling, animation, and AJAX calls. It promotes

		cross-browser compatibility and reduces code complexity.
Back-End	MySQL	Serves as the relational database management system used for storing, retrieving, and managing data efficiently. The phpMyAdmin tool is used for database management.
	PHP	A server-side scripting language responsible for processing user inputs, interacting with the database, and generating dynamic content.
Server	Apache (via XAMPP)	The Apache server, managed through the XAMPP control panel, is used to host the system locally during

		development. It ensures smooth communication between the front-end, back-end, and database components.

2.11 Hardware Requirements

Table 2

Components	Specification	Usage
Device RAM	Minimum: 4 GB Recommended: 16 GB	RAM supports fast, temporary data processing. While 16 GB is optimal for smoother performance, the system is lightweight and can function adequately with 4 GB RAM on low-end machines.
Processor	Minimum: Intel Core i3 Recommended: Intel Core i5 or higher	The processor handles all system operations and data processing. The system is optimized to

		work even on older or entry-level CPUs (such as Intel Core i3), making it accessible to low-end users.
Storage	SSD (Recommended: 128 GB or higher)	SSDs ensure fast data retrieval and storage of system files and reports. Flash storage is sufficient for mobile devices or low-end desktops with limited space.
Printer	Any Inkjet Printer	Used for printing audit reports, forms, and compliance documentation. No high-end printer is required — any standard inkjet printer is sufficient for output tasks.

2.13 System Evaluation

This section describes the evaluation procedures conducted on the system to assess its functional suitability, performance, and usability. The survey instrument is adapted from ISO 25010 Software Product Quality Standards. The test scale provides four options to respondents and rates the system based on the question, with 4 as the highest and 1 as the lowest.

Data were analyzed and interpreted based on the following parameters:

Table 3

Functional Suitability

Adjectival Rating	Scale Range (Mean)	Verbal Interpretation
4	3.50 – 4.0	Very Functional
3	2.50 – 3.49	Functional
2	1.50 – 2.49	Moderately Functional
1	1.0 – 1.49	Poor Functional

Table 3 presents the criteria used to evaluate a product or system's functional suitability according to the ISO survey.

Table 4

Performance Efficiency

Adjectival Rating	Scale Range (Mean)	Verbal Interpretation
4	**3.50 – 4.0**	**Very Efficient**
3	**2.50 – 3.49**	**Efficient**
2	**1.50 – 2.49**	**Moderately Efficient**
1	**1.0 – 1.49**	**Poor Efficient**

Table 4 outlines the scoring parameters used to assess the system's overall performance efficiency in executing its functions and tasks.

Table 5

Usability

Adjectival Rating	Scale Range (Mean)	Verbal Interpretation
4	3.50 – 4.0	Very Usable
3	2.50 – 3.49	Usable
2	1.50 – 2.49	Moderately Usable
1	1.0 – 1.49	Poor Usable

Table 5 presents the scoring parameters used to assess the system’s usability.

Table 6

Respondent's Distribution

SMCC Electronic Data Processing		
Position	**N (Population)**	**Percentage (%)**
Personnel	10	40%
Student	15	60%
Total	25	**100**

Table 6 outlines the distribution of respondents who participated in evaluating the system within the SMCC Electronic Data Processing. The respondents are categorized by position: 40% hold personnel roles and 60% are students. This indicates that most feedback comes from students directly interacting with the system. Since they are the primary users, their insights provide a more accurate assessment of the system's functionality, efficiency, and usability in real-world scenarios.

2.13 Research Ethical Standard

This project upholds the highest ethical standards to ensure integrity, transparency, and accountability in research. All procedures follow the institutional guidelines to promote responsible, fair, and ethical research practice.

A. Protection of Intellectual Property Rights (IPR)

The Capstone Project complies with Republic Act No. 8293, the Intellectual Property Code of the Philippines. The Integrated Service Portal ISP including its source

code, system architecture, workflows designs, and instructional materials is an original intellectual creation of the researchers and will be developed for the Electronic Data Processing Office of Saint Michael College of Caraga (SMCC). Any third-party software, libraries, icons, templates, and frameworks will be used under valid licenses, and citations will be provided. Since the project does not create a unique logo or brand for the ISP, trademark registration is not applicable.

B. Informed Consent

All participants, particularly EDP personnel and designated Staff from Saint Michael College of Caraga, will be informed and provided with a detailed explanation of the project's purpose, scope, objectives, procedures, expected involvement, and the minimal risk level associated with evaluating the ISP. The data collected, including feedback on system performance and participants' use of technology, will be used solely to improve the system project. Participation is entirely voluntary, and written consent will be obtained before any data-gathering activity. Participants will also be assured of their right to withdraw from the study at any time without negative consequences. As the study did not involve animal or living-organism trials, no additional ethical approval for animal welfare was required.

C. Data Privacy and Confidentiality

The project will fully comply with Republic Act No. 10173 (Data Privacy Act of 2012). Personal and institutional information collected through ISP will be transmitted securely and stored in an encrypted, access restricted database available only to

authorized personnel. While certain system functions require identifiable data, strict confidentiality, role-based access and security controls will be implemented to protect all information. Clear data retention policies will be followed, ensuring that records are kept only for as long as necessary and securely archived or deleted afterward. No information will be disclosed to third parties without participant's explicit written consent.

D. Voluntary Participation and Freedom to Withdraw

Participation in the study will be entirely voluntary, and all individuals involved in the ISP system evaluation will be clearly informed of their right to withdraw at any time without penalty or impact on their professional standing or academic status. Only individuals directly involved in the ISP evaluation process will be included as participants, and no animals will be involved in this study. No coercion or undue influence, or financial incentives will be used, ensuring that all participation is freely given and ethically sound.

E. Minimization of Harm and Risk Management

The project poses a minimal risk to participants, as their involvement is limited to using and evaluating a digital service platform. Digital safety will be ensured through encrypted logins, role-based access controls, secure data-handling procedures, and activity-audit tracking to prevent unauthorized access or misuse of information. No physical, psychological, or emotional harm is expected; however, participants can approach the researchers or the supervising faculty if they experience any discomfort during the evaluation process. No animal subjects are included in this study; thus, the 3Rs principles (Replacement, Reduction, Refinement) are not relevant. Since this is a low-risk

project, no debriefing interventions are needed; however, participants will be informed about the availability of related support services.

F. Beneficence and Contribution to Knowledge

The capstone project aims to enhance institutional effectiveness and strengthen SMCC's capacity for digital service delivery by implementing an improved Integrated Service Portal. Participants may not receive direct personal benefit, but their involvement contributes to refining system features and institutional supports for broader digital transformation initiatives. A summary of the research findings and associated system improvements will be made available to participants upon request. The outcomes of this project will also contribute to future technological innovations and operational enhancements within the institution, ensuring continued institutional benefit.

G. Justice and Fair Participant Selection

Participant selection will be based on an open, transparent, and objectively defined set of inclusion and exclusion criteria provided by the SMCC Electronic Data Processing Unit. Only those officially affiliated with the EDP Unit, such as designated staff, faculty, and student assistants, will be eligible to participate, and eligibility will be verified through institutional identification. A strict non-discrimination policy will be adhered to, ensuring that no participant's gender, ethnic background, social class, religion, or any other personal attributes irrelevant to the study affect participant inclusion or exclusion. External users and departments outside the EDP Unit will not be involved to maintain data security and ensure relevance to system operations. No animal participation or testing will be involved in this study.

H. Data Integrity and Accuracy

All information related to the design, testing, and evaluation of the ISP will be collected and documented with strict attention to accuracy, consistency, and integrity. Standardized procedures will be used to ensure reliable recording, interpretation, and analysis of all system performance data and participant feedback. AI tools may assist in organizing, summarizing, or refining content; however, all AI-generated outputs will undergo thorough human verification and validation to prevent errors, ensure correct interpretation, and maintain compliance with ethical research standards. This approach guarantees that all findings are accurate, responsibly produced, and aligned with accepted academic and institutional guidelines.

I. Transparency and Honesty in Reporting

The researchers pledge to the highest standards of integrity, and to report findings accurately, transparently, and comprehensively including both favorable and unfavorable results on the performance, methods, capabilities, and limits of ISPs. All copyrighted materials, frameworks, codes, and computer programs used in the study will be acknowledged appropriately to uphold academic honesty. Any potential conflicts of interest will be openly disclosed to maintain fairness and integrity in the reporting process. These standards assure the validity of the research and ensure that ethical and institutional expectations are met.

J. Use of Patented or Copyrighted Materials

The ISP will be an original system developed by the researchers, while selected open-source libraries, templates, and digital resources will be integrated into it in full

compliance with their respective open-source license terms and conditions, including attribution, usage limitations, and share-alike provisions, where applicable. No patented technologies will be used in the design or implementation of the system. If the system demonstrates institutional viability, the researchers, together with SMCC, may pursue a formal patent application with the Intellectual Property Office of the Philippines (IPOPHL) to protect its intellectual property rights. All components of the project must be developed in strict adherence to copyright laws and ethical standards, with proper authorization, acknowledgment, or attribution

K. Ethical Considerations for Animal and Human Trials

The study will not involve any clinical or biomedical experimentation; thus, participants will only take part in digital system testing and provide feedback. They will be informed of the system's purpose, features, and limitations to ensure transparency and to help them understand any minimal risks involved in accessing the system and handling data. Human participant safety will be upheld by ensuring that no physical, psychological, or emotional harm expected and that participants are free to withdraw at any time without penalty. No animal subjects are required for this research; therefore, no ethical clearance for animal studies is needed.

L. Responsible Use of AI and Other Related Technologies

Artificial intelligence tools were utilized only as supportive aids in the research process; ChatGPT was used to organize preliminary ideas and summarize initial insights, and Grammarly was used to enhance language clarity and grammatical accuracy. The researchers ensured complete transparency by clearly documenting when and how AI

tools were used. All outputs supported by AI underwent rigorous human validation and verification to avoid inaccuracies, misinterpretations, or reliance on automated content. The use of AI was limited to non-analytical, non-decision-making tasks, ensuring that all interpretations, conclusions, and research judgments remained totally researcher-driven, thus maintaining the ethical use of AI and complete integrity and accountability of the study.

M. Ethical Clearance and Institutional Approval

The capstone project will be submitted for full ethical review and clearance to the Institutional Review Board (IRB) of Saint Michael College of Caraga. Formal approval from the appropriate institutional committee will be secured before the start of any data collection, system testing, or participant involvement to ensure full compliance with ethical standards. This approval process ensures compliance with all applicable guidelines on data protection, intellectual property rights, and the treatment of human participants. The project will not proceed to any operational or evaluative phase until official ethical clearance has been granted.
