ACKNOWLEDGEMENTS

First and foremost, the researchers would like to express their deepest gratitude to Almighty God for the wisdom, strength, and guidance He has bestowed upon them throughout the completion of this capstone project. Without His divine inspiration and grace, overcoming the challenges encountered along the way would not have been possible.

The researchers are sincerely thankful to their dedicated adviser, Mr. Jessie S. Mahinay, for his unwavering support, valuable insights, and continuous encouragement. His guidance and constructive feedback have been instrumental in the successful completion of this capstone project and in the researchers' academic and professional development.

The researchers are also profoundly grateful to their families and peers for their steadfast support, motivation, and understanding throughout the duration of this study. Their encouragement and patience have been a constant source of strength and inspiration for the researchers. This capstone project stands as a product of collective effort, and the researchers humbly extend their appreciation to all individuals and institutions who contributed, directly or indirectly, to its realization and success.

CHAPTER 1

INTRODUCTION

1.1 Project Context

Classroom evaluation helps monitor teaching performance, improve instruction, and support teachers' growth. It offers a straightforward way to see how teachers deliver lessons, engage students, and use teaching methods. This process helps schools ensure teaching meets academic standards and learning goals. When done well, it supports reflection and continuous improvement in teaching and learning.

However, at Saint Michael College of Caraga (SMCC), the evaluation process is still conducted manually on paper. This old method creates several issues. It slows down the collection and checking of results. It makes it hard to store and sort paper records. It also leads to mixed-up feedback from different reviewers. These problems make evaluations less efficient and less reliable. They also make the process less helpful for teacher growth. As schools use more technology, SMCC's current system is falling behind.

To solve these problems, we propose the AI-Driven Classroom Evaluation System. This system will move evaluations online, automatically calculate scores, and generate clear feedback written by AI. The input will highlight teacher strengths, identify areas for improvement, and offer development steps. The system will also store all data in a digital database and create combined reports. This will make classroom evaluations at SMCC more organized, fair, and efficient.

REVIEW OF RELATED LITERATURE

This chapter reviews studies that support the development of the Automated Classroom Evaluation System. It examines digital evaluation platforms and AI feedback systems and identifies a research gap that this study will fill.

Digital Transformation of Evaluation Systems

Moving from paper-based evaluations to digital platforms is a key step in modernizing education. Research [1] highlights the well-known limits of traditional systems, leading to the development of information-based systems for fair, multi-perspective assessment. [2] showed that moving to web-based systems greatly improves administrative efficiency, data access, and processing speed. The COVID-19 pandemic accelerated this shift [3], [4], proving that online systems help schools operate during disruptions, despite challenges with digital access and user skills.

In the Philippines, studies on online faculty monitoring and classroom observation support this [5], [6]. They show that digital tools are widely accepted and effective for managing education and supporting teachers. [7] also validated a web-based evaluation model for teacher programs, confirming its validity, reliability, and practicality.

Synthesis: The literature shows that digital transformation solves core inefficiencies of paper systems. These platforms create the needed infrastructure for data collection and

management. They offer a clear path for schools like SMCC to update their evaluation processes. However, success depends on good digital infrastructure and user training.

Computational and Data-Driven Approaches in Assessment

Going beyond simple digitization, using data analytics and machine learning moves educational assessment toward evidence-based methods. For example, [8] improved a Weighted Naïve Bayes algorithm for teaching evaluation, achieving better accuracy than traditional approaches. A key development in this area is explainable AI. Research [9] showed that systems using explainable AI can give clear, helpful feedback that boosts student motivation and self-regulation.

This shift toward explainable, data-driven systems marks a change from just automating scores to creating meaningful, justified feedback. Big data also plays a significant role. Studies [10] and [11] proposed systems that use data mining and analytics to make evaluations more objective and scientific. These systems help solve problems, such as how to weigh different evaluation criteria.

Synthesis: Computational methods are a step past basic digitization. They enable a move from intuition-based to evidence-based assessment. Explainable AI is essential because it shows how decisions are made. This builds trust and gives helpful guidance for improvement, not just unclear scores.

Automated Feedback Generation for Instruction and Learning

A key use of advanced computation in education is the creation of automated formative feedback. Studies show that systems using Large Language Models (LLMs) can provide scalable, helpful support. [12] ran a trial showing that feedback from GPT-3.5 helped secondary students improve their writing, feel more motivated, and have more positive emotions. Likewise, [13] found that students strongly preferred GPT-4 feedback over human tutors for its clarity and helpfulness.

These tools are also helping teachers. [14] created an NLP tool that, through a trial, helped teachers use student ideas more often and talk less during class. [15] used BERT models to assess how teachers guide classroom discussions, matching human performance automatically. [16] suggests that the focus should now move from just using these tools to using them effectively and ethically.

Synthesis: Automated feedback systems can significantly improve both student learning and teacher growth. They provide timely, detailed feedback at scale, boosting both knowledge and attitudes. Users generally like these systems. However, to succeed, teachers need to adjust their roles, and these tools should be carefully blended into teaching to support—not replace—human guidance.

Advanced Systems for Classroom Observation and Evaluation

The most advanced work in this field uses multimodal data analysis to automate and improve classroom observation. Traditional observation is often subjective and time-consuming. Research also shows that different tools measure different parts of teaching, so they should be used with care [17], [18].

To address this, researchers are building automated systems. Early tools that analyzed only one type of data—such as lecture transcripts—aligned well with student surveys on lesson structure. However, they were less effective at judging clarity because they missed nonverbal cues such as tone and body language [19].

To solve these limits, current research now focuses on comprehensive multimodal systems. For example, [20] created “ClassMind," which combines video, audio, and text analysis to produce teaching feedback. [21] Also built a system using YOLOv8 and LLMs to automatically assess teacher performance and student engagement.

This progress includes automating well-known analysis methods. For instance, [22] applied automation to code Flanders Interaction Analysis with high accuracy. On a broader level, [23] proposed a complete AI framework for evaluating teachers against specific performance goals.

Studies agree on a key insight: automated systems are excellent at spotting objective, structured patterns. But they still need human experts to handle nuanced, subjective judgment [24], [25].

Synthesis: Advanced classroom observation is moving from single-method analysis to multimodal systems that give a fuller, more objective view of the classroom. Research supports

a hybrid “human-in-the-loop” model. This approach uses automation for speed and consistency in behavioral analysis, while keeping human judgment for context and subtlety.

The research shows a clear path of progress. It starts with digital platforms that fix fundamental inefficiencies, moves to data-driven systems that give deeper insights, and now includes advanced multimodal tools that automate classroom analysis. Global research is quickly moving toward complex, automated evaluation systems [20], [21], [23].

However, there is a large gap between these global advances and what is happening locally, including at SMCC. Local studies have successfully pushed for moving evaluations online [5], [6]. But they have not yet added computational analysis to generate structured, narrative feedback from evaluation data automatically.

International studies strongly support the use of such automated feedback for professional growth [14], [15], [9]. Yet in the Philippines, this potential is still not widely used in formal classroom evaluation systems at the institutional level.

This study aims to bridge that gap. We will develop an Automated Classroom Evaluation System for SMCC that combines a reliable web platform with computational analysis. The system will not just collect data digitally. It will also automatically process scores to produce structured feedback reports. These reports will highlight strengths, suggest areas for improvement, and give actionable recommendations. This will make evaluation at Saint Michael College of Caraga more efficient, objective, and focused on teacher development.

1.3 Objective of the Study

The general objective of this study is to design, develop, implement, and evaluate an AI-Driven Classroom Evaluation System that automates teacher performance assessment and generates data-based feedback for instructional improvement.

Specifically, it aims to:

1. Design a digital classroom evaluation system that allows the President, VPACAD, Deans, Principal, Chairpersons, and Subject Coordinators to conduct teacher evaluations efficiently using laptops or mobile devices.
2. Integrate an artificial intelligence feature that analyzes and generates automated feedback, including strengths, areas for improvement, recommendations, and agreements.
3. Implement a reporting system that generates comprehensive evaluation reports with detailed insights on teaching performance, including identified strengths, areas of improvement, and recommendations for professional development.
4. Evaluate the developed system against ISO 25010 Software Quality Standards to assess its functionality, efficiency, and overall usability.

1.4 Scope and Limitations

This study focuses on creating an AI-Driven Classroom Evaluation System for Saint Michael College of Caraga (SMCC). Only authorized academic staff can use the system. This includes the President, Vice President for Academic Affairs (VPACAD), Deans, Principal, Chairpersons, Subject Coordinators, and Teachers.

The system will do several things. It will turn the paper evaluation form into a digital one. It will automatically calculate average scores. It will also use AI to create feedback. This feedback will cover strengths, areas to improve, recommendations, and agreements. All evaluation data will be stored safely in a central database.

Users can access the system on laptops or mobile devices. The goal is to make evaluations faster, better organized, and more fair.

This study does not include some advanced features. It will not use video recording, audio analysis, facial recognition, or emotion detection. The AI's feedback is based solely on scores and predefined rules. Staff must check and approve this feedback before it is final.

The system needs internet or a local network to work. It will not connect to other school systems, such as payroll or human resources, unless added later. Changing the evaluation form beyond SMCC's current format is not part of this study.

For security, the system will have basic login protection and safe data storage. More security may be needed if the system is used by more people in the future.

1.5. Definition of Terms

Agile Methodology – The step-by-step approach used to build the system. It uses short cycles of planning, building, and testing.

Artificial Intelligence (AI) – A field of computer science. It creates systems that can perform tasks that generally require human thinking, such as solving problems and understanding data.

AI-Driven Classroom Evaluation System – A digital platform for SMCC. It automates classroom evaluation with digital scoring, database storage, and AI-generated reports.

Classroom Evaluation – A structured way to measure how well a teacher performs. It is based on observing lesson delivery, class management, student engagement, and teaching methods.

Consolidated Results – Combined evaluation scores and feedback organized by the system. This makes it easier to understand and make decisions.

Database – A secure digital storage space. It holds evaluation data, teacher records, and feedback reports.

Digitization – Changing paper-based processes into electronic systems. This makes work faster, better organized, and more reliable.

Evaluator – A person approved to assess teacher performance. Examples include deans, coordinators, or trained observers.

Evaluation Criteria – The specific standards used to judge teachers during classroom observations. These are usually based on school rubrics.

Feedback Generation – The AI process that creates written comments about a teacher's strengths, weaknesses, and suggested improvements.

Paper-Based Evaluation – The old manual method using paper forms. It requires handwritten notes, hand-calculated scores, and physical storage.

Pedagogical Practices – The teaching behaviors and methods that instructors use in class.

Score Automation – The system's ability to calculate and summarize evaluation scores automatically, with no manual math needed.

System Interface – The part of the software that users see and interact with. It is where they enter data, view results, and navigate the system.

Teacher Performance – How effective a teacher is overall. It is based on class management, lesson delivery, student engagement, and following teaching standards.

Web-Based System – An application that runs in a web browser. Users can enter evaluation data and create reports online.

Role-Based Access Control (RBAC) – A security feature. It controls what each user can see and do based on their role in the system.

CHAPTER 2

TECHNICAL BACKGROUND

Research Design

This study will use a Design and Development Research (DDR) approach. We will create and test the AI-Driven Classroom Evaluation System (ADCES). This system uses artificial intelligence to improve evaluation management. It reduces processing delays and makes the evaluation process clearer and more transparent.

Software Development Life Cycle

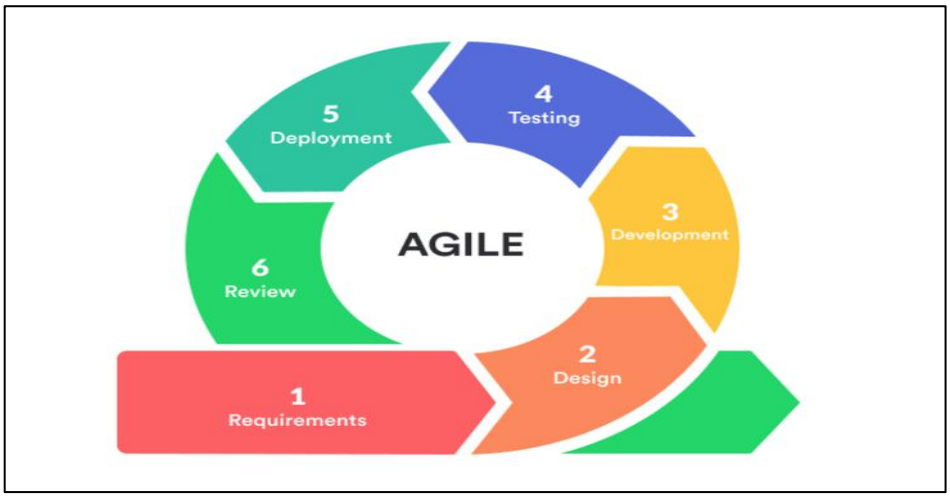

Figure 1. Agile Methodology

This diagram illustrates how the Agile Methodology is used to develop the AI-Driven Classroom Evaluation System (ADCES). Agile uses short, repeated work cycles called sprints. In each sprint, we design, build, and test a working part of the system, focusing on AI features delivered through APIs. This approach is flexible and encourages teamwork among administrators, evaluators, and teachers rather than adhering to a fixed, linear plan. The process

begins by planning and defining requirements for AI features, such as automated feedback generation, each sprint includes designing, coding, and testing specific modules, as well as integration testing for the connected APIs. Feedback from each sprint is used to improve the system's efficiency and AI accuracy. Using Agile ensures the system is modular, scalable, and able to meet the changing needs of a modern, classroom evaluation service.

2.1 System Architecture

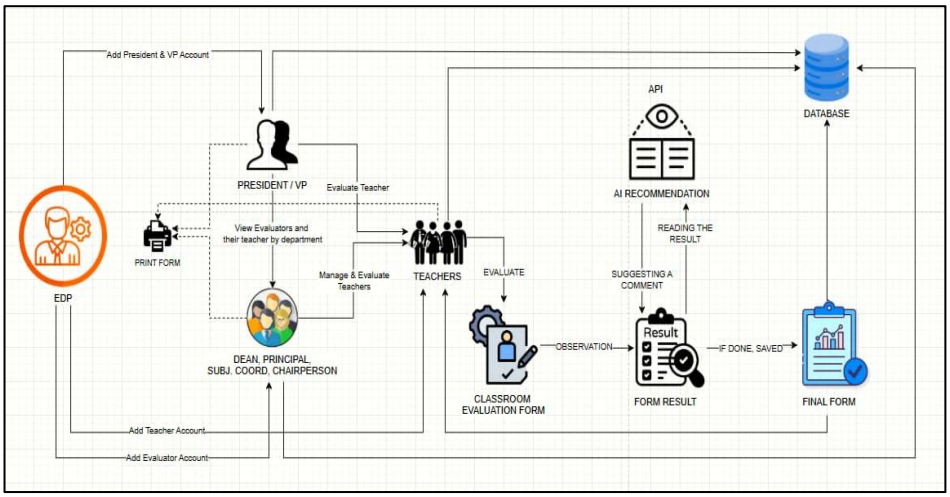

Figure 2: System Architecture

The system architecture shows how different users work with the platform based on their roles. The EDP Office creates accounts for the President/VP, Deans, Principals, Subject Coordinators, Chairpersons, Evaluators, and Teachers. After accounts are made, the President/VP can see evaluators and teachers in each department, print forms, and evaluate teachers. Deans, Principals, Subject Coordinators, and Chairpersons manage and assess the teachers assigned to them.

Teachers are evaluated using the Classroom Evaluation Form. This form records observations and ratings. After evaluation, the data is sent to the Form Result section for processing. The system then uses an AI Recommendation Module accessed via an API. This AI analyzes the results and suggests improvement comments. Once the AI reviews the results, the evaluator finalizes the evaluation. The completed data is stored in the Database. Once finalized, the assessment becomes part of the Final Form for official record-keeping.

2.2 Conceptual Diagram

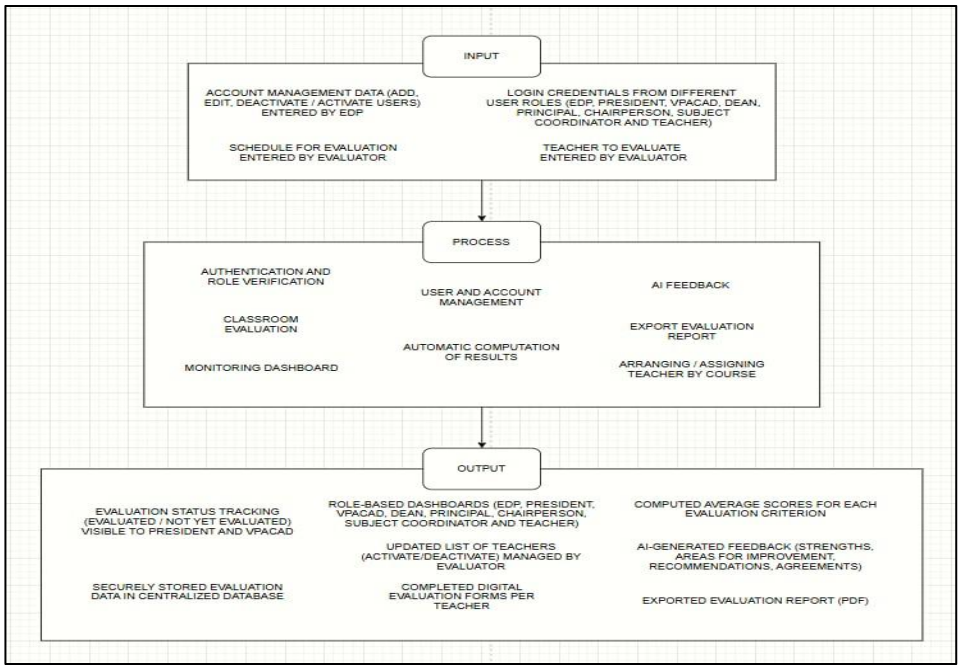

Figure 3: Conceptual Diagram

The IPO diagram illustrates how the Classroom Evaluation System operates from data entry to final output. In the Input stage, the EDP enters account management data, such as adding, editing, activating, or deactivating users. Evaluators input schedules for classroom evaluation and identify which teachers will be evaluated. Different system roles—including EDP, President, VPACAD, Deans, Principals, Chairpersons, Subject Coordinators, and Teachers—also log in using their own credentials. In the Process stage, the system performs authentication and role verification to ensure secure access. It manages all user accounts, handles the classroom evaluation process, and automatically computes the results. A monitoring dashboard provides real-time updates, while the AI module generates feedback and suggestions based on the computed results. The system can also export evaluation reports and arrange teachers based on

assigned subjects or courses. Finally, the Output stage presents role-based dashboards tailored to each user type, showing evaluation statuses, updated teacher lists, and completed evaluation forms. The system stores all evaluation data in a centralized database and produces computed scores, AI-generated insights, and exported PDF reports. Overall, the IPO framework highlights the flow of data through the system—from input, to automated processing, to organized and actionable output.

2.3 Use Case Diagram

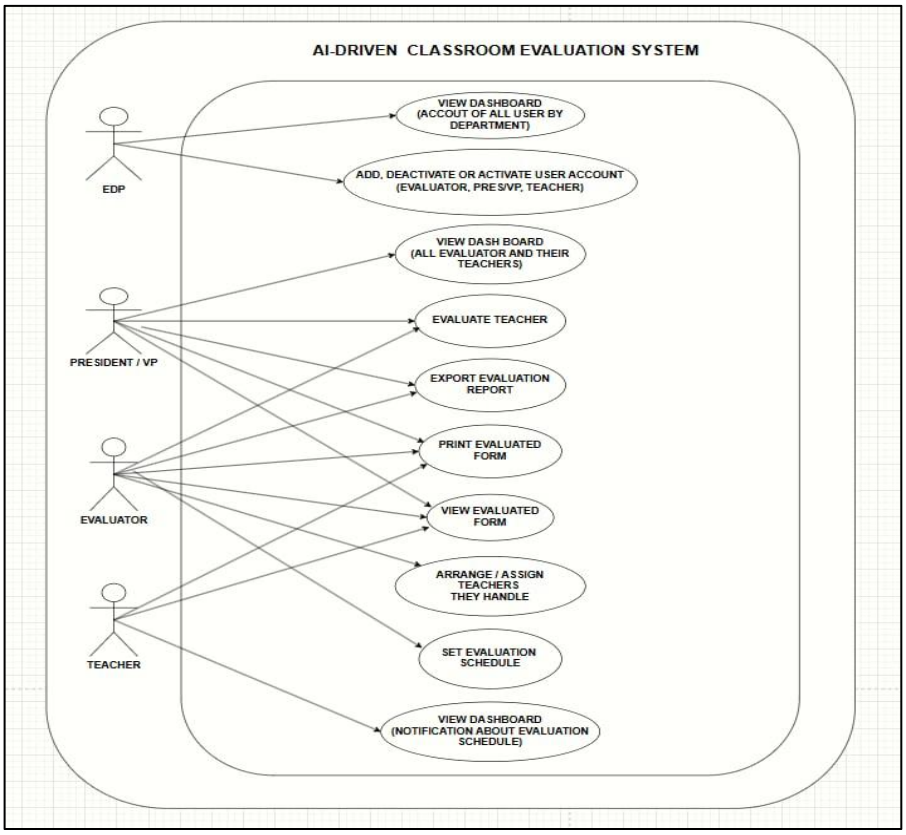

Figure 4: Use Case Diagram

The Use Case Diagram for the AI-Driven Classroom Evaluation System shows what each user role can do. It creates a transparent workflow.

- **EDP Administrator**: Manages all user accounts and views the department dashboard.

- **President/VP**: Oversees the whole process. They can view evaluator assignments and access reports.

- **Evaluator**: Handles the main tasks: scheduling, assigning, and conducting teacher evaluations.

- **Teacher**: Has a more reactive role. They mainly view their own schedule and evaluation results.

Overall, the diagram clearly shows how each role contributes to a smooth, organized evaluation process.

2.4 Activity Diagram

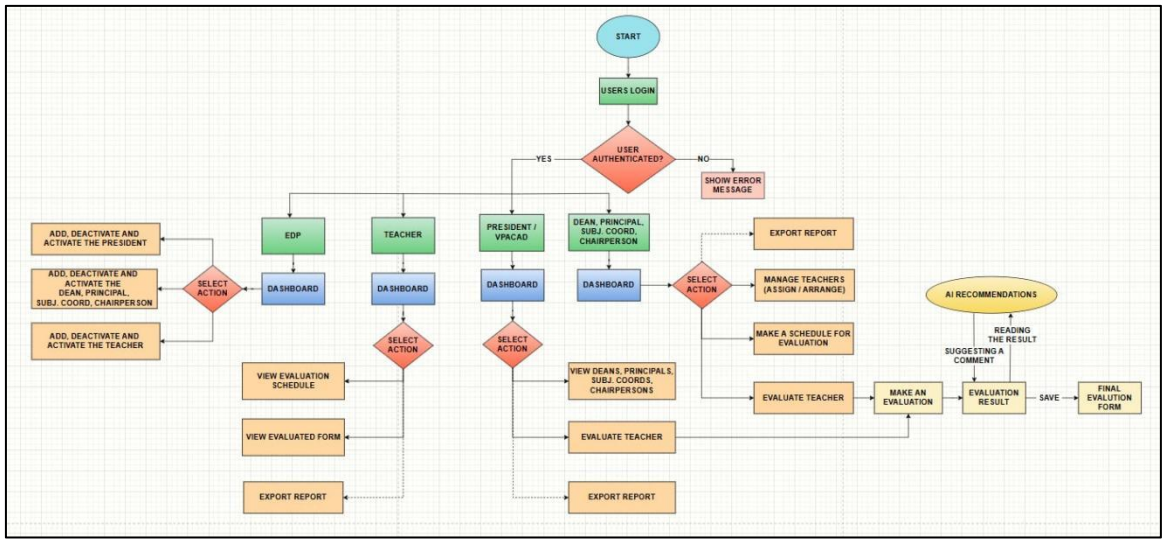

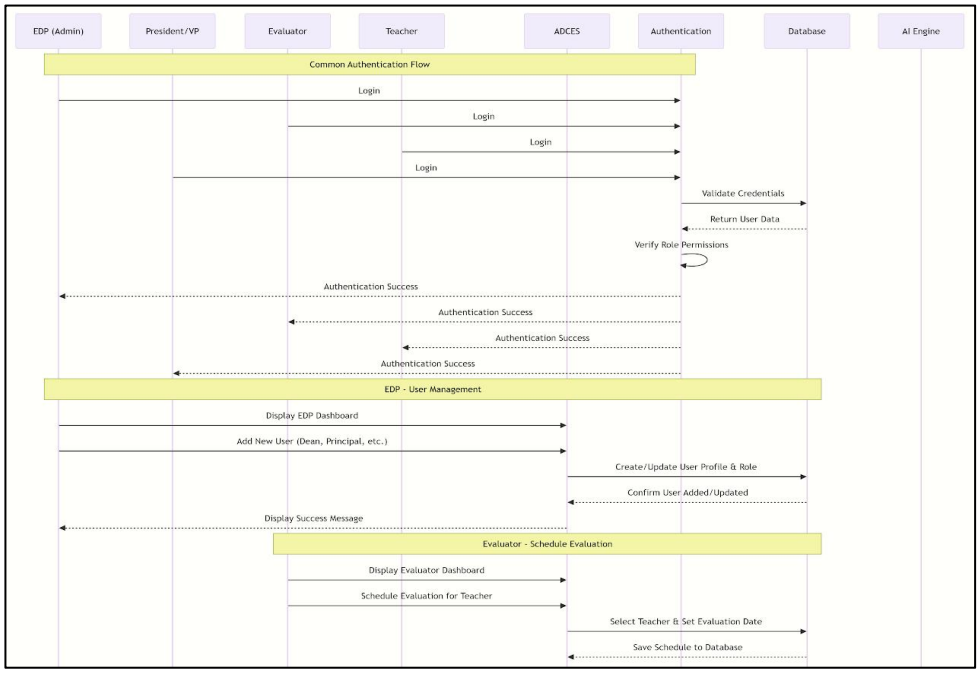

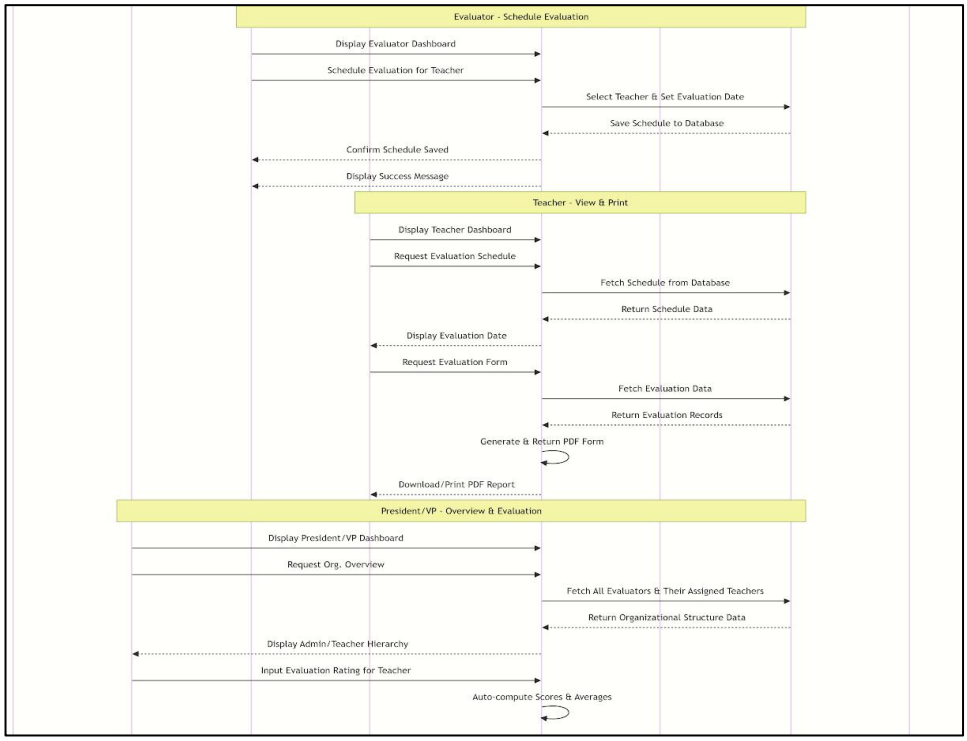

Figure 5: Activity Diagram

This activity diagram shows the whole workflow of the evaluation system. It starts with user login and authentication. Then, each user goes to a dashboard based on their role.

On their dashboard, users can take specific actions. For example, they can view schedules, manage teachers, create evaluation timelines, evaluate teachers, and export reports. Administrators—such as EDP —can also add, deactivate, or activate users in different positions. Evaluators move through the evaluation steps. This results in an evaluation, which is saved as a final evaluation form. Next, the system uses an AI recommendation module. This module reads the results and creates suggested comments or insights. This completes the evaluation cycle and helps support informed decision-making.

2.5 Sequence Diagram

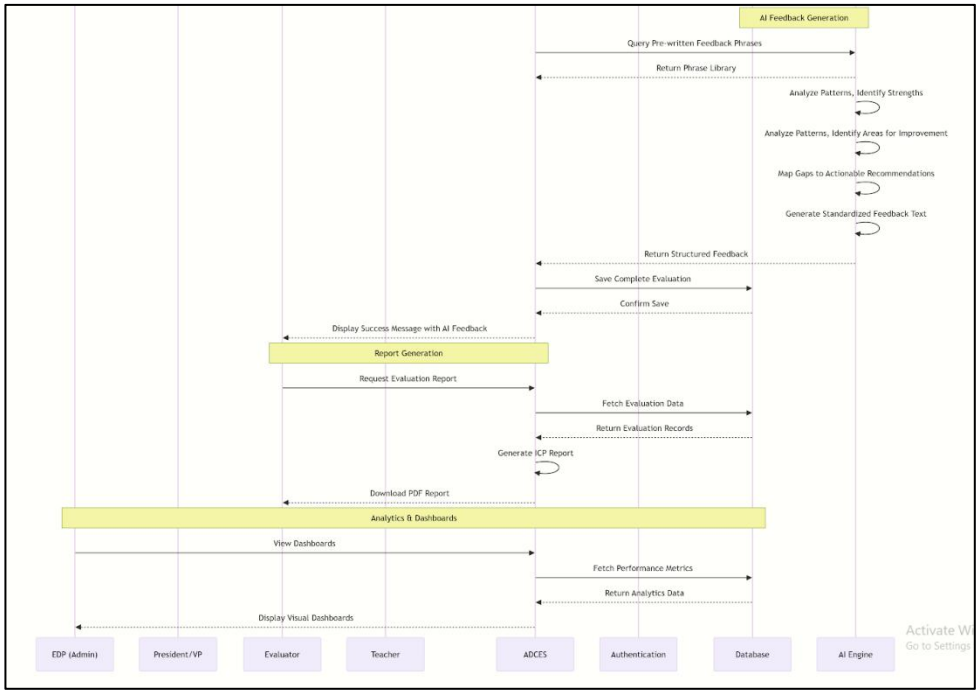

Figure 6: ADCES Sequence Diagram

The AI-Driven Classroom Evaluation System (ADCES) is a complete, role-based platform. It manages the whole teacher evaluation process. The system starts with a central login. This sends users to dashboards made for their roles. ADCES helps with scheduling, managing forms, and creating reports. Its built-in AI engine also analyzes evaluation data. It automatically generates standard feedback, highlights strengths and areas for improvement, and provides recommendations.

By seamlessly connecting user interfaces, database operations, and AI, ADCES makes evaluation efficient, consistent, and data-driven. This gives helpful insights to everyone in the school.

2.6 ERD (Database Design)

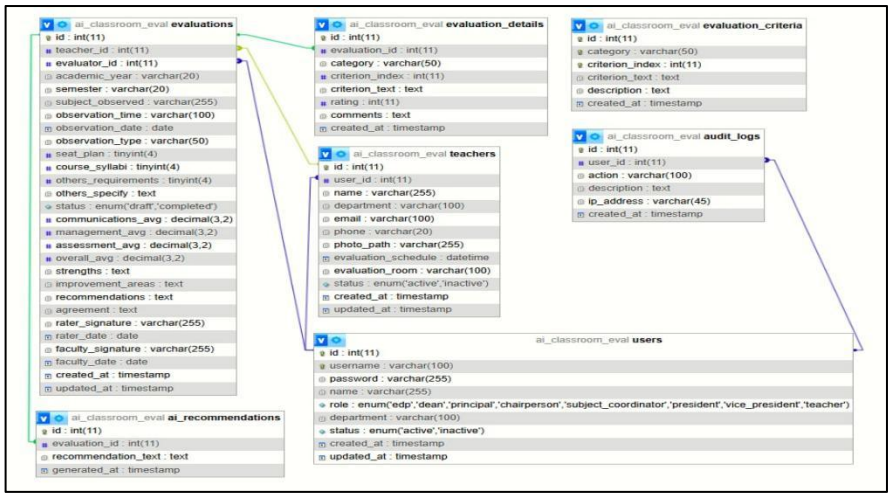

Figure 7: Entity Relationship Diagram (ERD) Diagram

Illustrates the Entity-Relationship Diagram (ERD) used by the AI-Driven Classroom Evaluation System to organize its data. It illustrates how the database entities support the handling of teacher evaluations and related assessment data.

2.7 User Interface Design (Prototype)

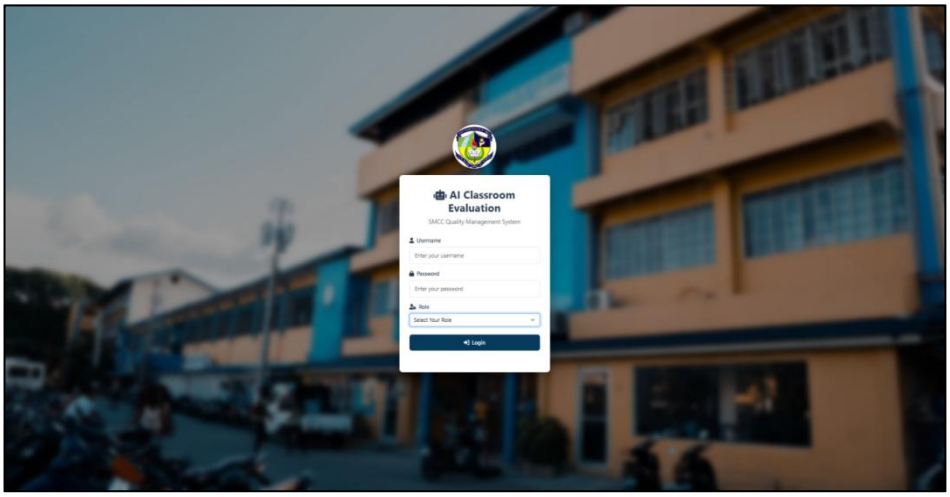

Figure 8: Landing Page Dashboard

Displays the landing page for the SMCC AI Classroom Evaluation system. The interface features a login form where users must enter their username and password, select their role, and click a button to access the system.

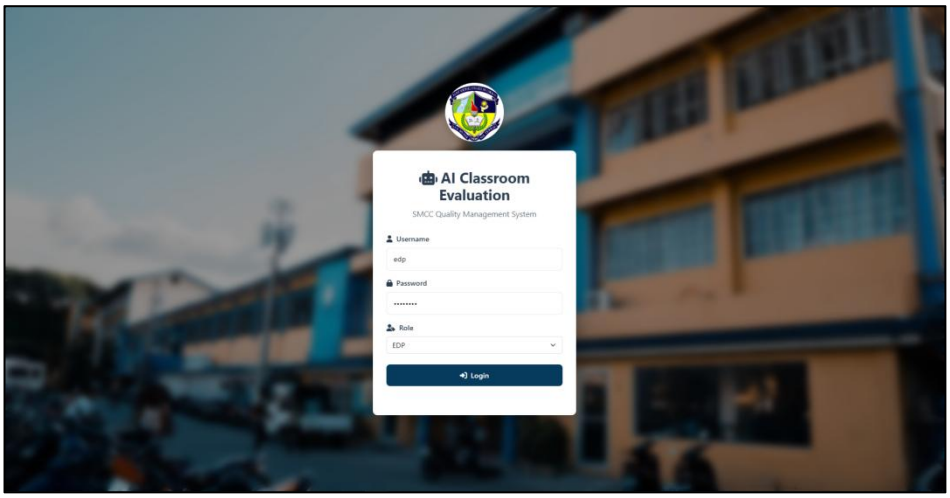

Figure 9: Login Page

Shows the login interface for the SMCC AI Classroom Evaluation system. It allows Evaluators and Teachers to sign in using their username and password to access the quality management platform. The interface includes role selection for customized access and a login button to authenticate and enter the system.

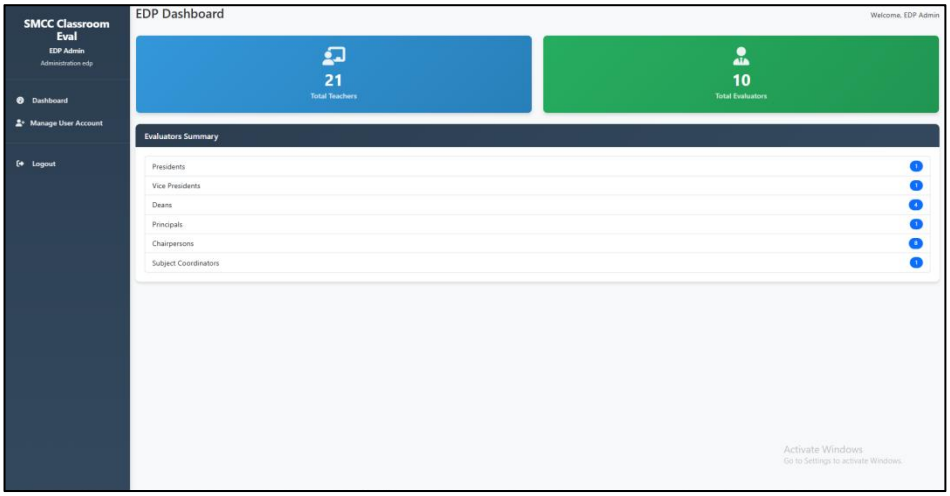

Figure 10: Edp Dashboard

Displays the main dashboard for the EDP (Data Processor) Administrator. The interface provides a centralized administrative view, featuring a system overview with key metrics like the "Total Teachers" (30) and a clear summary of all evaluator roles (Presidents, Vice Presidents, Deans, etc.). The primary available function is "User Account Management," which allows the administrator to efficiently manage all system accounts.

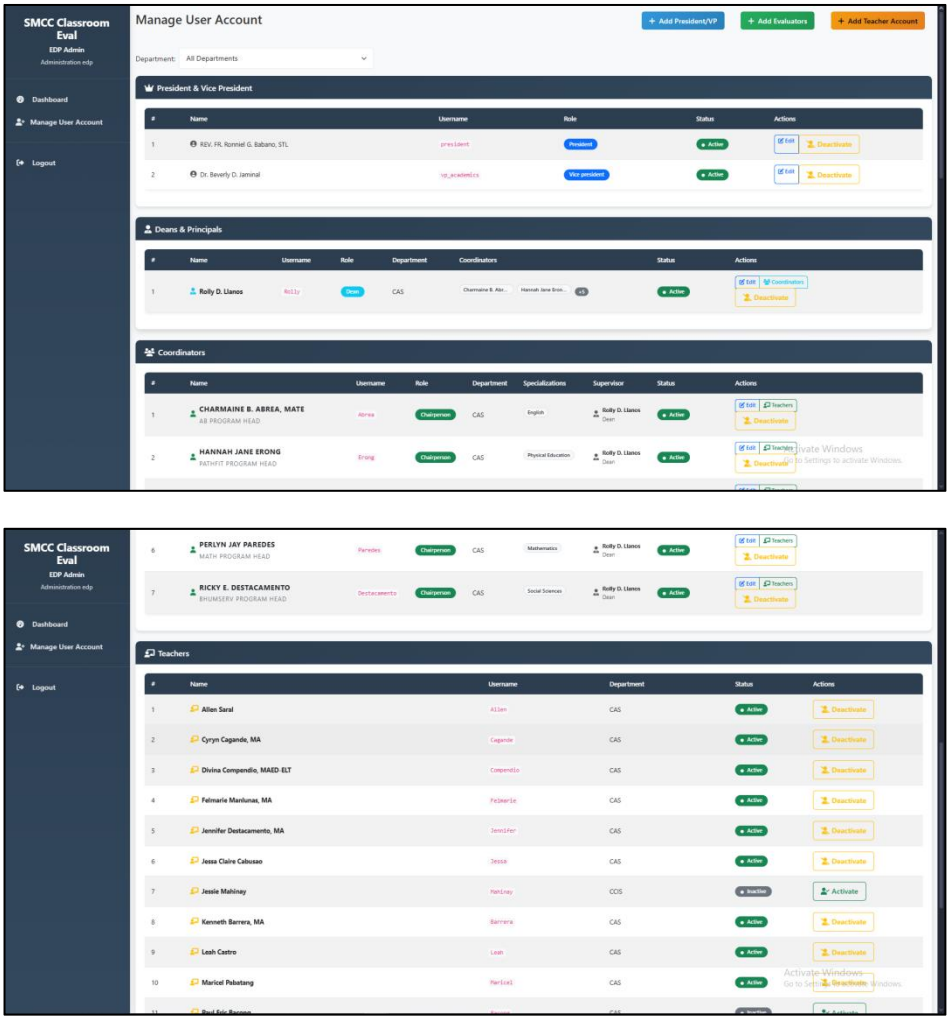

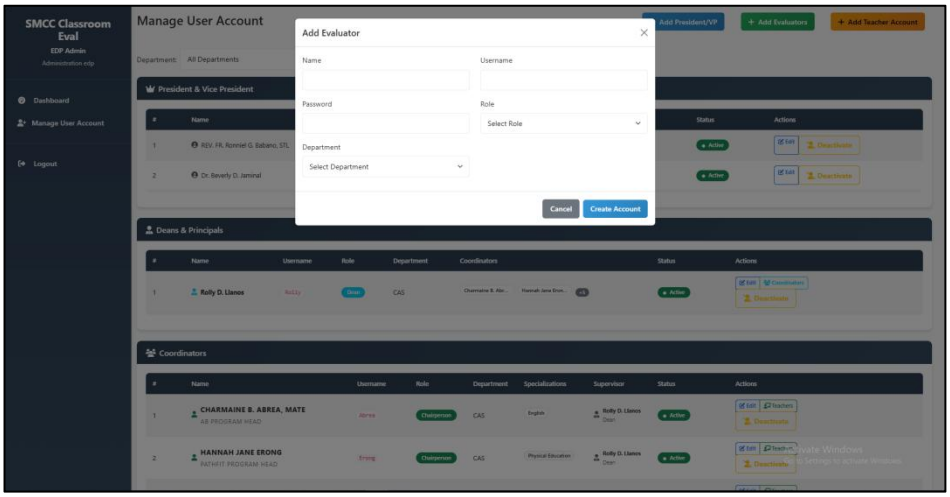

Figure 11: EDP Administrator - User Management Dashboard

Displays the User Management dashboard for the EDP Administrator, providing centralized control over system accounts, with the President and Vice Presidents listed for deactivation or editing, while enabling role-based management: Deans can assign coordinators, and Coordinators can add teachers within their specific academic fields.

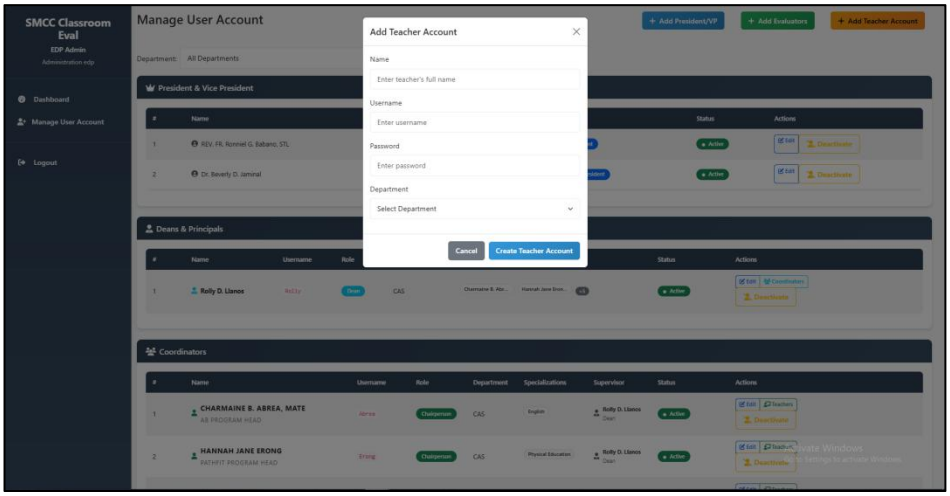

Figure 12: EDP Administrator - Comprehensive User Management

This screen shows the User Management interface for the EDP Administrator. It includes multiple sections for creating and managing accounts. The EDP can use forms to add accounts for Presidents and Vice Presidents, Deans and Principals, Coordinators

There is also a separate section for creating teacher accounts, which includes assigning them to departments. The interface allows the EDP to oversee all user roles and their statuses across the entire institution.

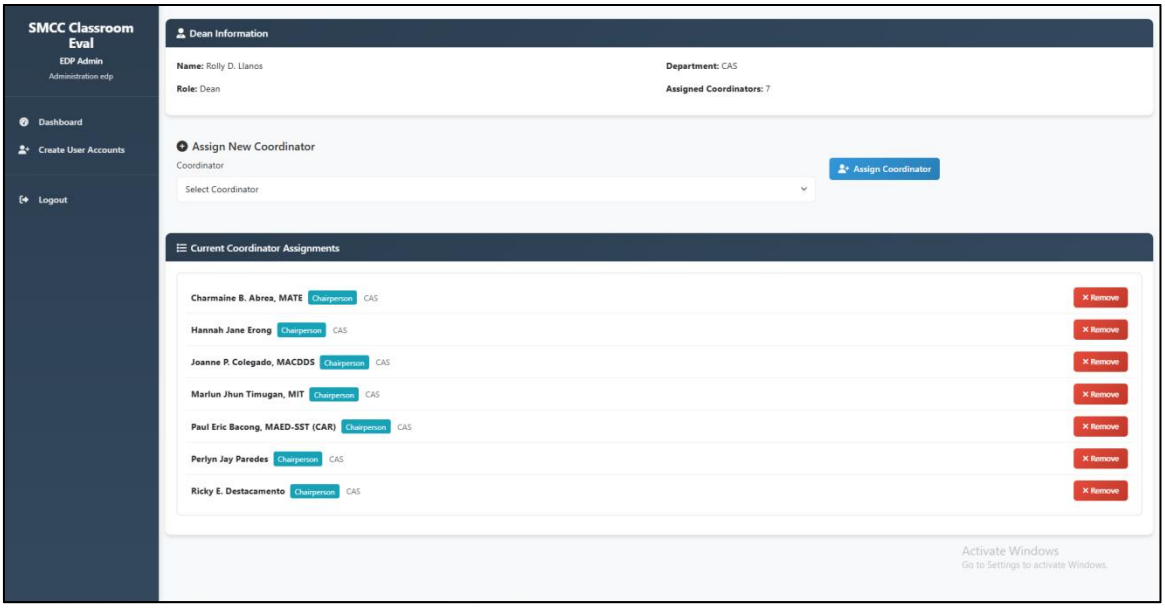

Figure 13: EDP Administrator - Dean Coordinator Management Interface

Displays the EDP Administrator's interface for managing dean-coordinator assignments, showing Dean Roly D. Llanos of the CAS department with 7 currently assigned coordinators, where the EDP Administrator can assign new coordinators via a selection system or remove existing coordinator assignments via individual action buttons.

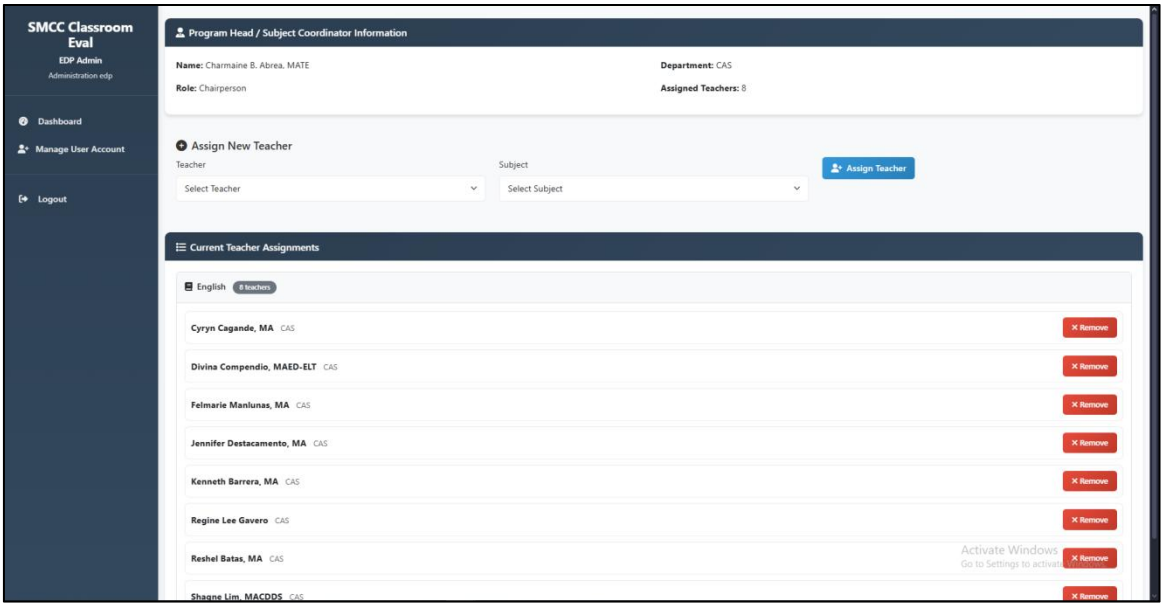

Figure 14: Program Head/Subject Coordinator Teacher Management

Shows the page where a chairperson can assign teachers to their subject area. The chairperson (Charmaine B. Abrea) currently has eight teachers assigned. The system allows them to select and assign new teachers to their department.

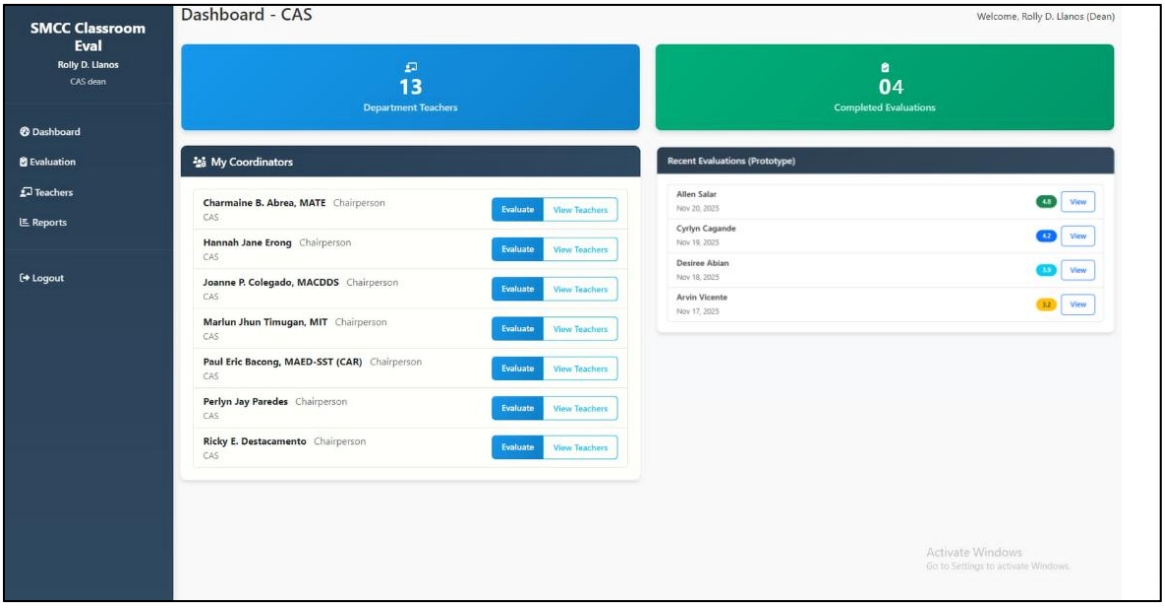

Figure 15: Dean/Principal Dashboard

This screen shows the central dashboard for a department head (Rolly D. Llamos from CAS). It gives a complete overview of the evaluation activity. Key metrics show there are 30 Teachers under supervision. The dashboard includes main menu options for Evaluation, Teachers Reports, Logout.

Quick Actions let the user manage teachers and view reports quickly. The dashboard also shows both Recent Evaluations and Completed Evaluations. This displays the evaluation history of faculty members with dates. Overall, this dashboard serves as the central hub for monitoring and managing faculty evaluations in the department.

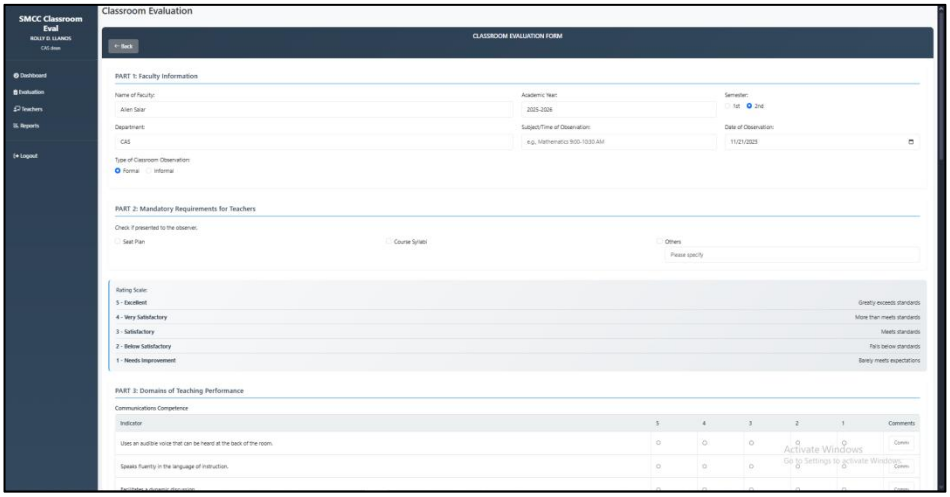

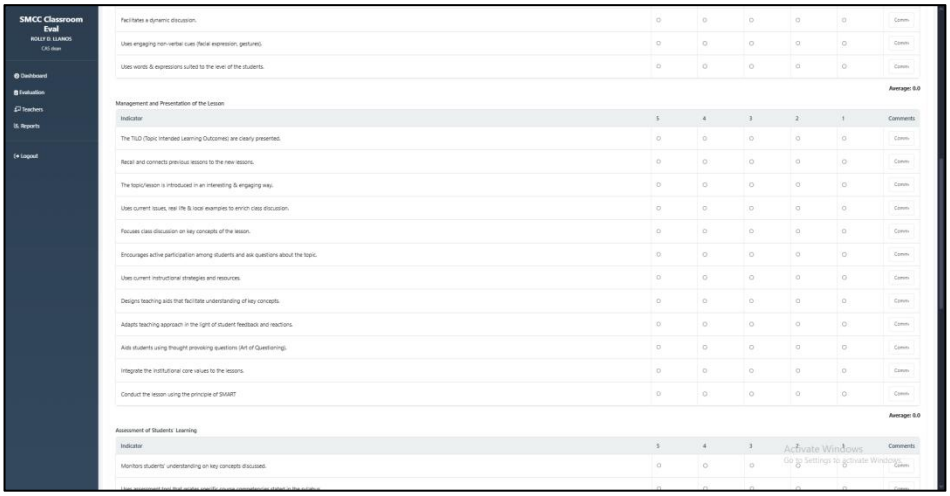

Figure 16: Teacher Selection Interface for Evaluation

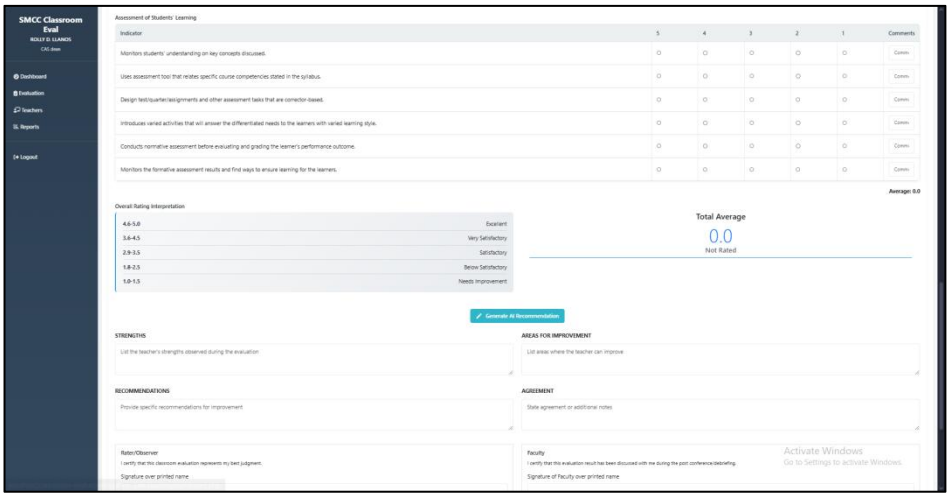

This screen shows the teacher selection page for evaluators. It is the starting point for evaluations. It shows a complete list of teachers, such as Allen Salar, Arvin Clark Vicente, Cecilio

Arriola, and others. The evaluator can choose any teacher to assess. The page includes a search bar to quickly find teachers. It also has the same menu options on all pages: Dashboard, Evaluation, Teachers, and Reports.

When the evaluator selects a teacher from the list, the system opens the evaluation form. There, the evaluator will rate and assess the teacher's classroom performance.

Figure 17: Classroom Evaluation Form

This screen shows the Classroom Evaluation Form used to assess faculty. The form is divided into three main parts:

Part 1: Faculty Information

This section collects basic details, including the teacher's name, academic year, and observation information.

Part 2: Mandatory Requirements

Here, necessary teaching materials are checked. Each item is rated on a 5-point scale.

Part 3: Teaching Performance

This section evaluates three critical areas:

1. Communications Competence
2. Management and Presentation of the Lesson
3. Assessment of Students' Learning

At the end, the system provides AI-generated feedback. This includes strengths, areas to improve, and specific recommendations in the evaluation summary.

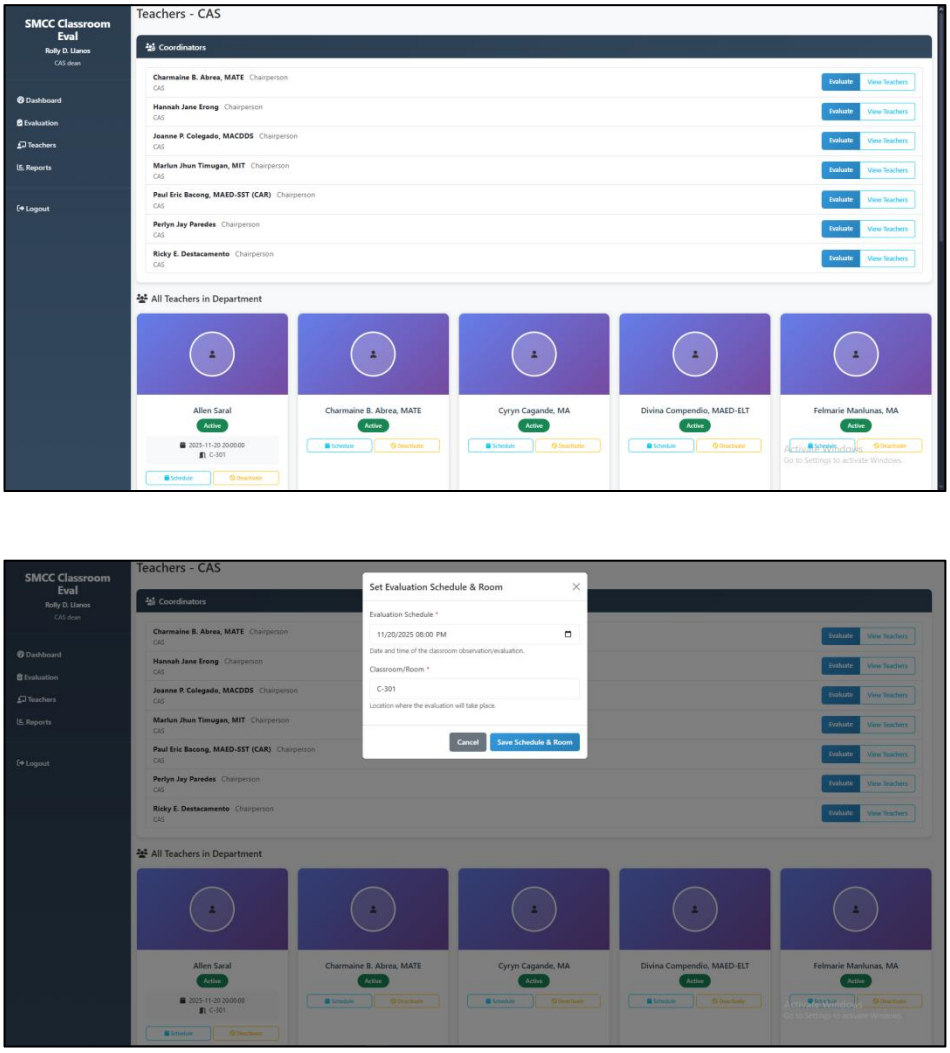

Figure 18: Faculty Management Interface/Set Schedule for evaluation

Displays the Faculty Management interface for the College of Arts and Sciences (CAS), accessed by administrator ROLLY D. LLANOS. This interface serves two primary functions: it allows administrators to set evaluation schedules for faculty members within the CAS department. It provides a deactivation feature for teachers who are no longer teaching at SMCC.

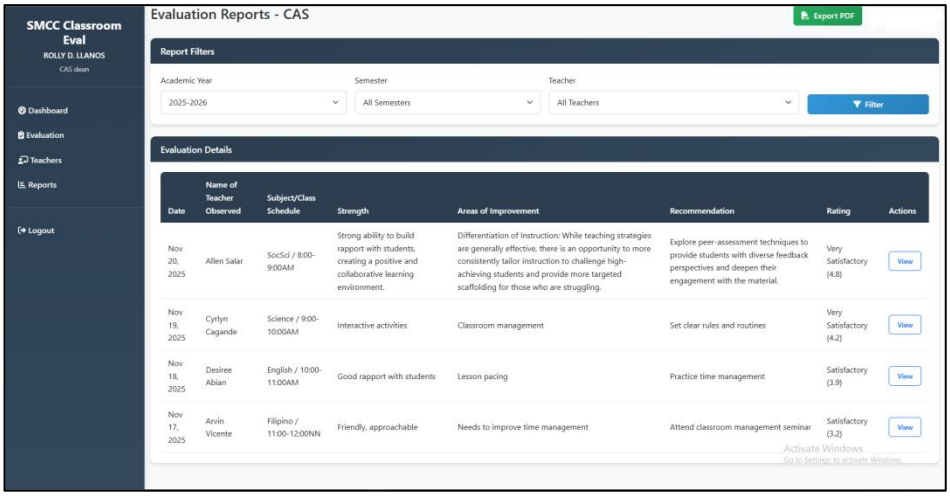

Figure 19: Evaluation Reports

This screen shows the Consolidated Evaluation Reports dashboard. It gives a complete summary of faculty assessment data for the institution. The dashboard shows overall evaluation metrics and a detailed table of completed evaluations. Each row in the table includes:

- Evaluation date
- Faculty member's name
- Subject and schedule
- Strengths
- Areas of Improvement
- Recommendations
- Rating
- Actions

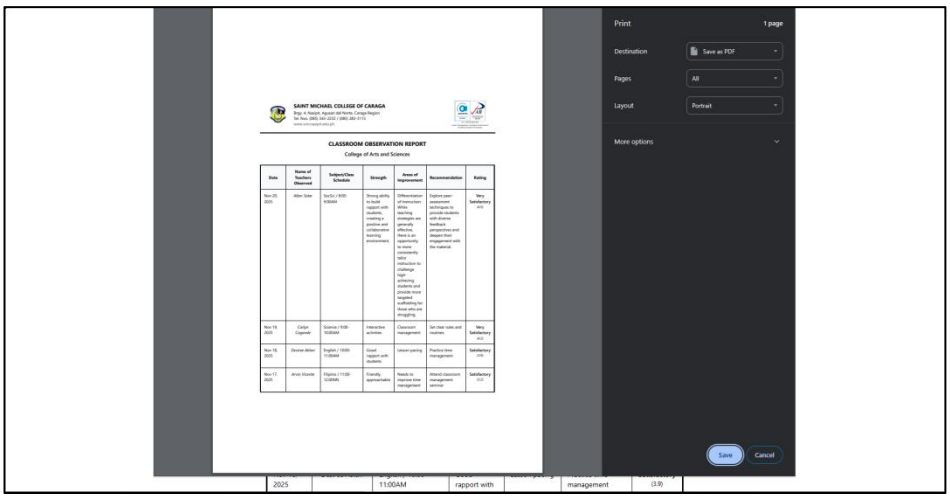

Figure 19: Dean PDF Export/Print Interface for Reports

This screen shows the official "Classroom Observation Report" in PDF format. It was created for the College of Arts and Sciences. This export feature gives a formatted summary of faculty evaluations. The summary includes:

- Observation dates
- Faculty names
- Subjects
- strengths
- Areas for improvement
- Recommendations
- Ratings

The report shows the official header of San Michael College of Caraga. It also includes printing options such as "Save as PDF," page selection, and layout settings. This lets administrators create formal documents of evaluation results for records, meetings, or official reviews.

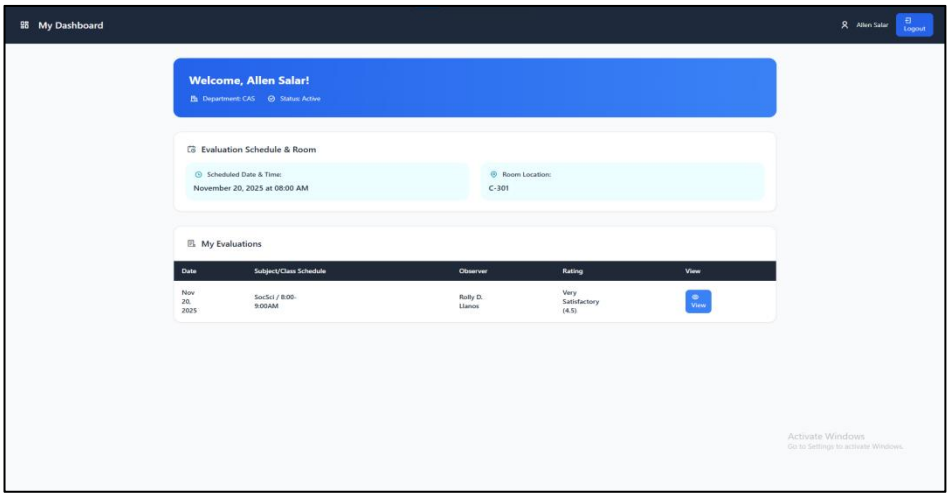

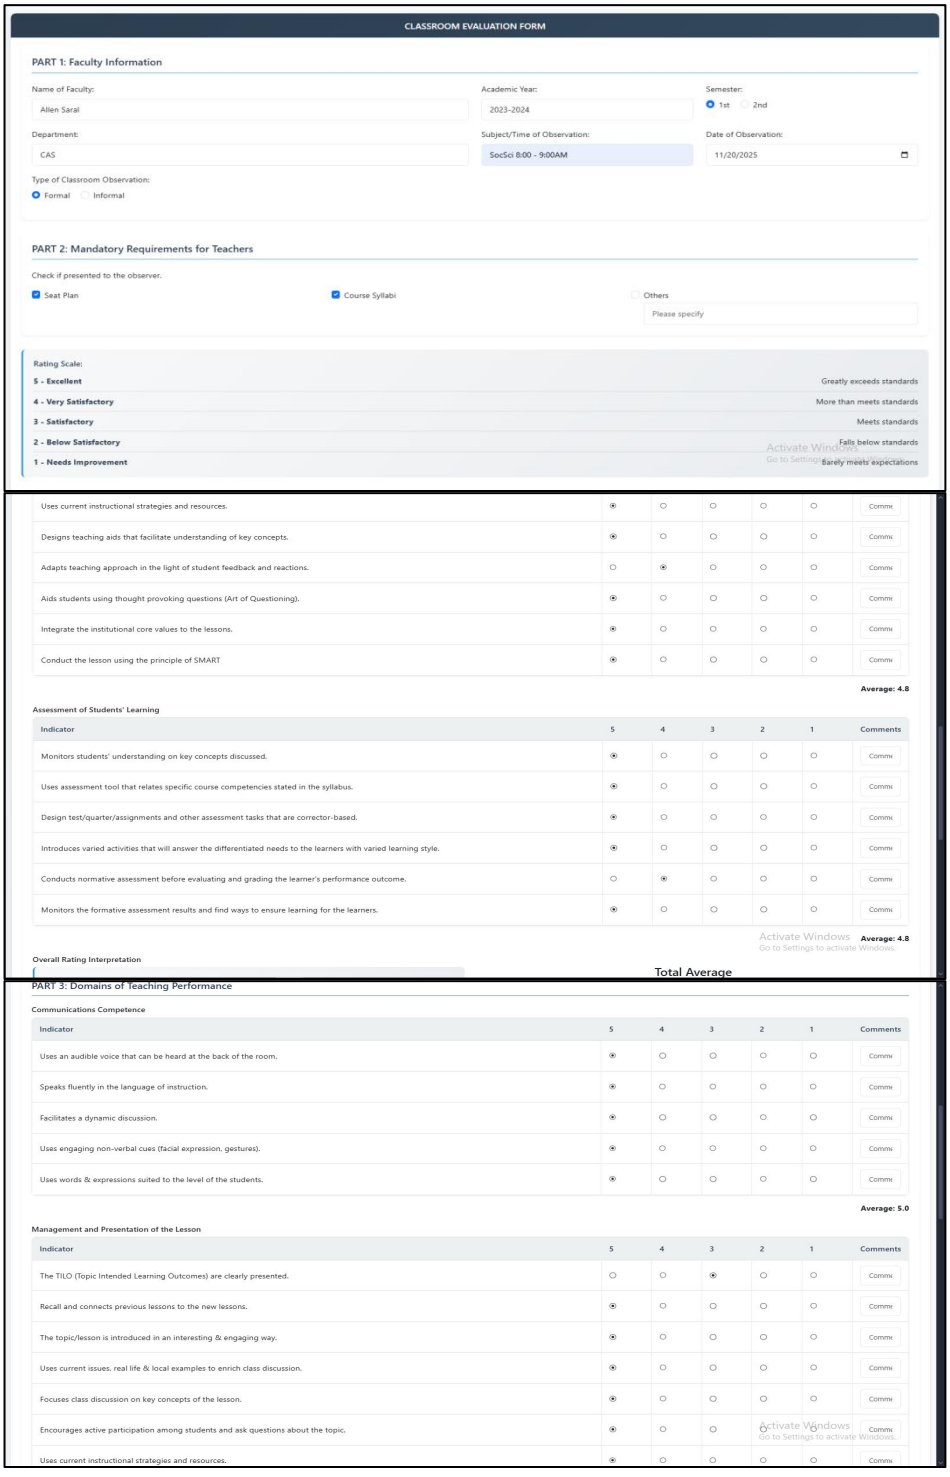

Figure 20: Faculty Dashboard - Post-Evaluation View

This screen shows the faculty dashboard for teacher Allen Salar after an evaluation is completed. The screen displays:

- The teacher's personal details (CAS department, active status)
- Upcoming evaluation schedule (November 20, 2025, at 08:00 AM in Room C-301)
- A record of past evaluations, including:
- Observer's name (Rolly D. Llanos)
- Subject and class time (SocSci/ 8:00 - 9:00AM)
- Final rating (Very Satisfactory - 4.6)

This dashboard gives teachers a complete view of their upcoming evaluations and past results. It helps them track their teaching performance over time.

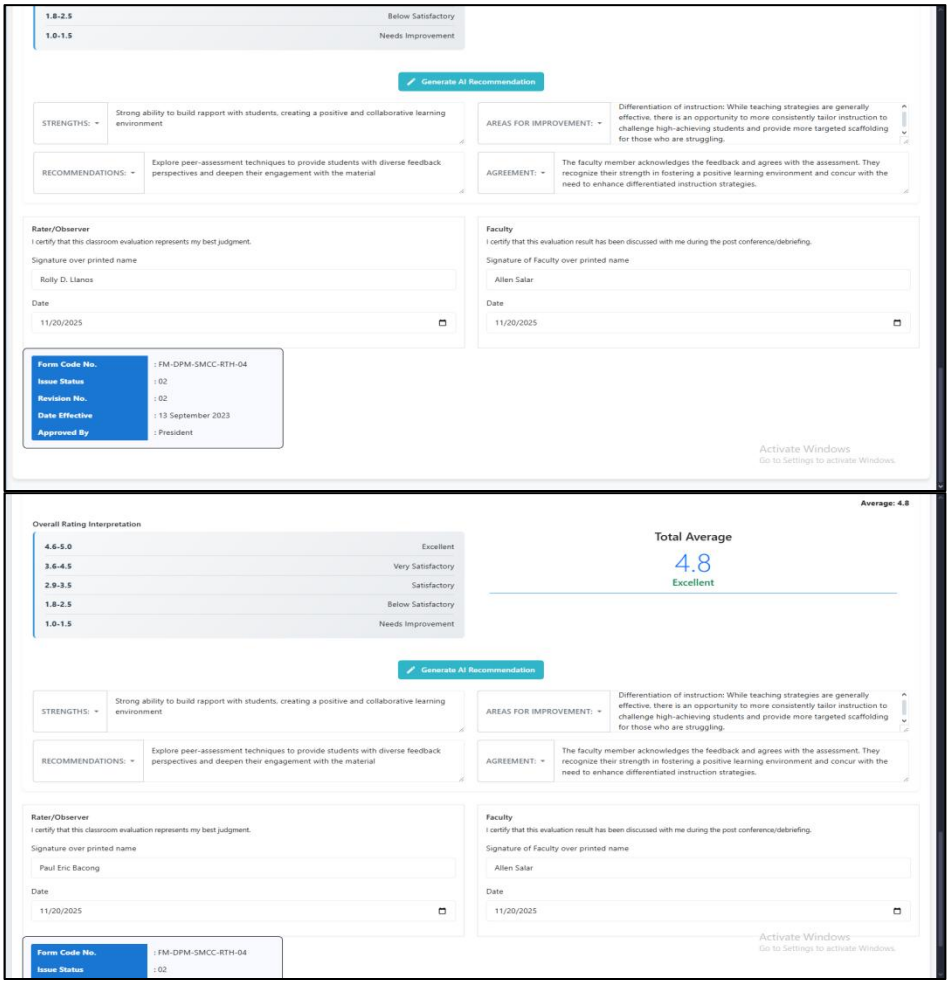

Figure 21: Completed Evaluation View Interface

This screen shows the full view of a completed classroom evaluation for teacher Allen Salar. It appears when an administrator clicks the "View" button in the evaluation records.

The form shows all parts of the evaluation:

1. Faculty information and observation details (SocSci, 11/20/2025)
2. Mandatory requirements checklist
3. Detailed ratings in three teaching areas:
4. Communications Competence (Average: 5.0)
5. Management and Presentation of the Lesson

6. Assessment of Students' Learning (Average: 4.8)

The evaluation ends with an overall **Excellent** rating (4.8) and AI-generated feedback on strengths and areas for improvement. It also includes formal certification sections with signatures from the observer (Rolly D. Llanos) and the teacher. This confirms that the evaluation was discussed after class.

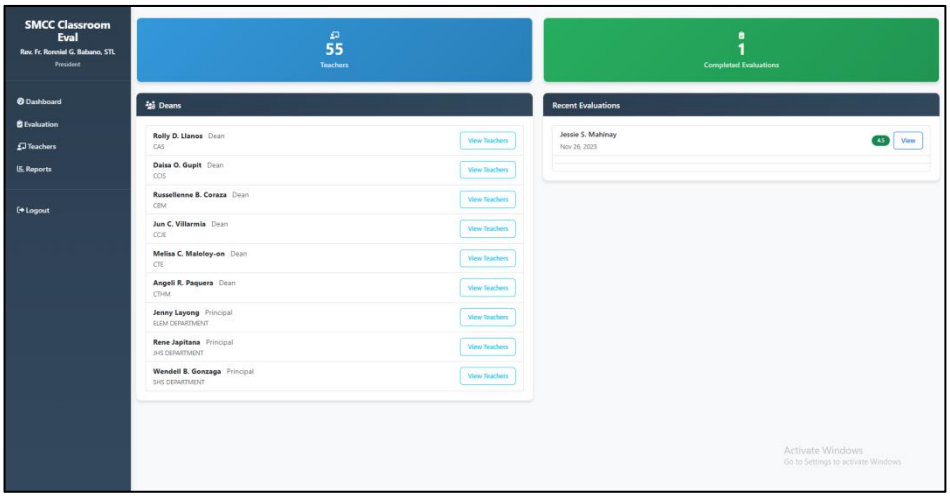

Figure 22: President/Vice President Dashboard

Displays the institutional overview dashboard for the President (Rev. Fr. Ronniel G. Babano, STL). This high-level interface provides a complete institutional summary, showing 55 total faculty members across all departments and one completed evaluation. The dashboard displays a comprehensive list of all Deans and Principals, including Deans for CAS, CCIS, CBM, CCJE, CTE, CTHM, and Principals for Elementary, JHS, and SHS Departments.

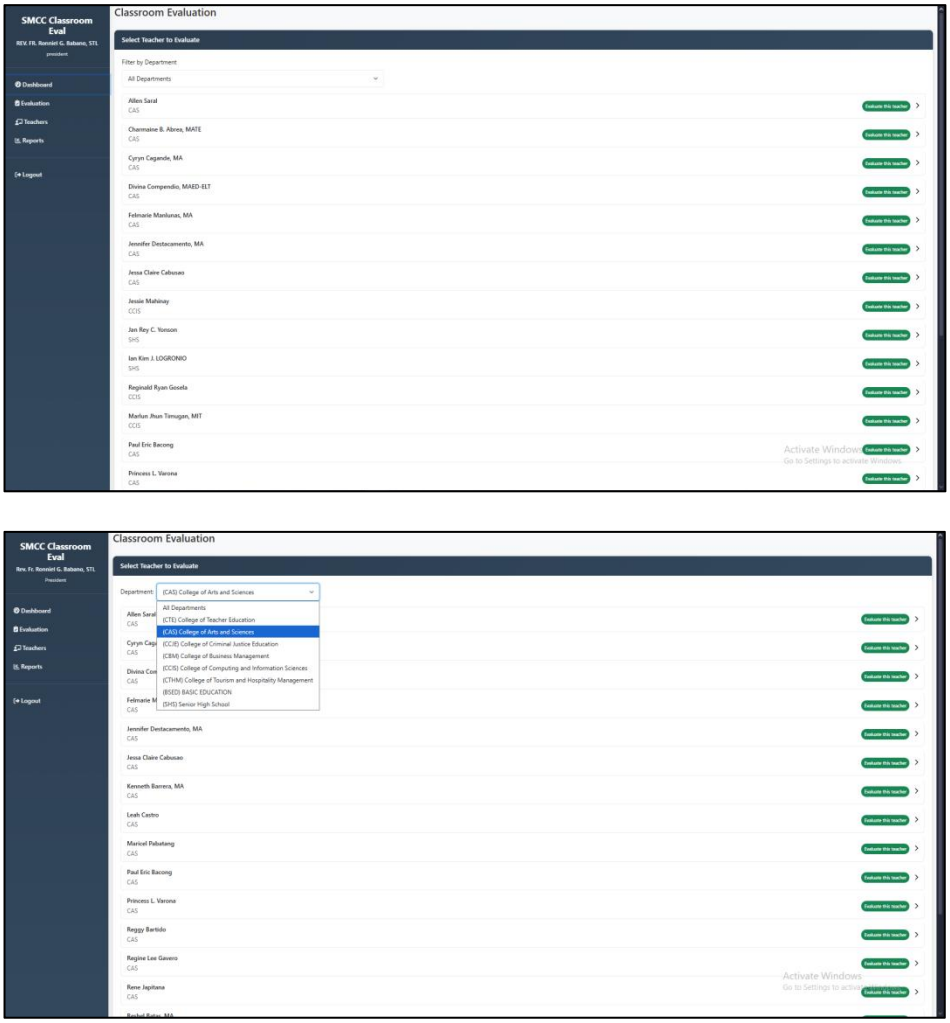

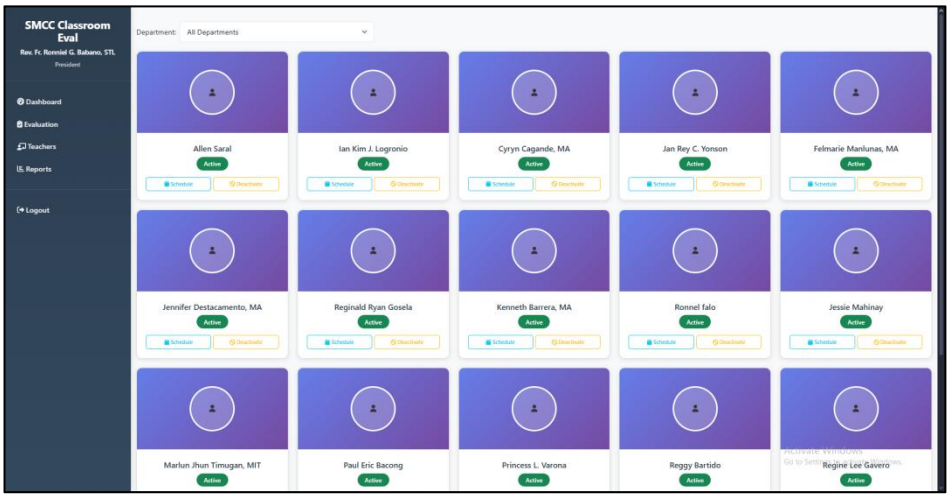

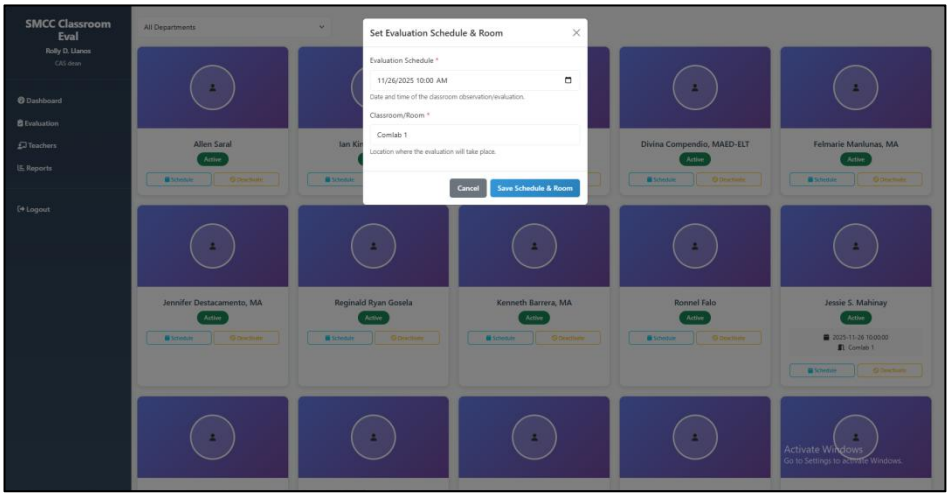

Figure 23: President/Vice President - Teacher Selection for Evaluation

This screen shows the teacher selection page for the President or Vice President to conduct evaluations. The page lists all faculty members from every department and level in the school, including CAS, CCIS, CBM, CCJE, CTE, CTHM, and Basic Education (Elementary, JHS, SHS).

The screen has a department filter. This lets the user sort teachers by college or department. The President or Vice President can select any teacher from any academic unit for evaluation. This shows their authority to evaluate across the whole institution.

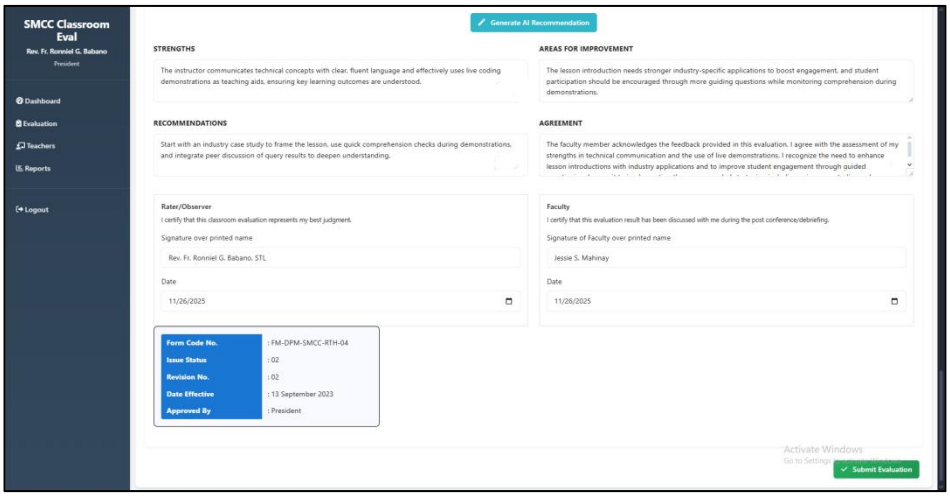

Figure 25: President's Classroom Evaluation Form

This screen shows the completed Classroom Evaluation Form. President Rev. Fr. Ronniel G. Babano is evaluating Jessie S. Mahinay from the CCIS department.

The form shows the teacher was assessed in three main areas:

- Communications Competence (Average: 4.6)
- Management and Presentation of the Lesson (Average: 4.2)
- Assessment of Students' Learning

This results in a final **Very Satisfactory** rating (4.3).

The evaluation lists specific strengths in technical communication and live demos. It also suggests improvements, such as using industry case studies and checking students' understanding.At the end, there is a formal agreement section signed by both the President and the teacher. This confirms that the evaluation was discussed after the class.

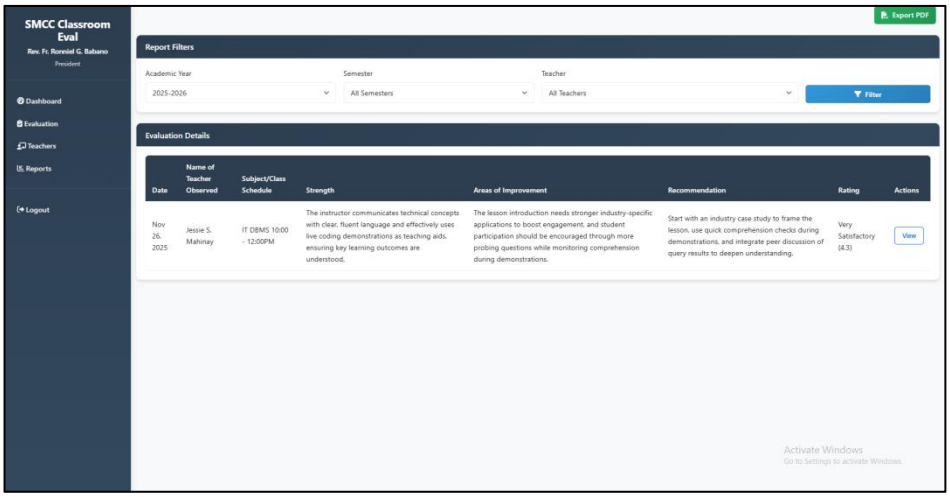

Figure 26: President's Evaluation Reports Dashboard

This screen shows the Evaluation Reports dashboard for the President (Rev. Fr. Ronniel G. Babano). It provides complete reporting tools. You can filter the reports by academic year, semester, teacher. The dashboard shows detailed evaluation records. Each entry lists faculty performance details, including specific strengths areas for improvement, recommendations.

Each evaluation also shows the teacher's name, subject and schedule, and performance rating. For example, one entry shows Jessie S. Mahinay's "Very Satisfactory (4.1)" rating for IT DBMS.

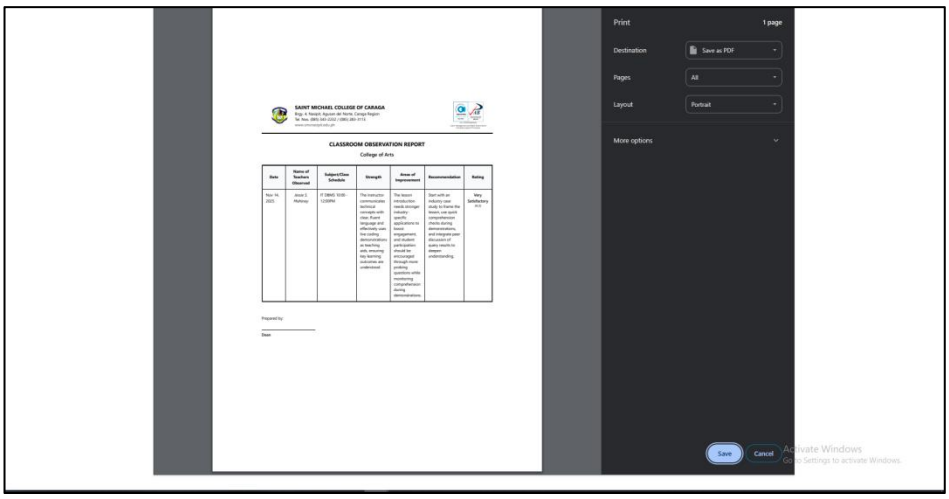

Figure 27: PDF Export/Print Interface for Reports

This screen shows the PDF export and print screen for the President's reports. This feature lets the President create official documents from evaluation data. The President can choose where to print, save layout settings and which details to include

The screen creates an official "Classroom Observation Report" in a printable format. It includes the school's header and space for signatures. This lets the President make physical or digital copies of faculty evaluations. These can be used for school records, meetings, or official reviews.

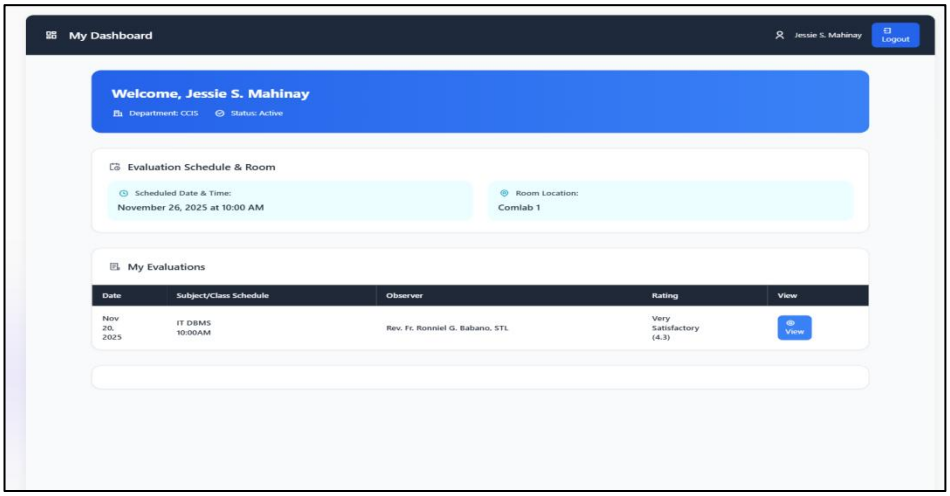

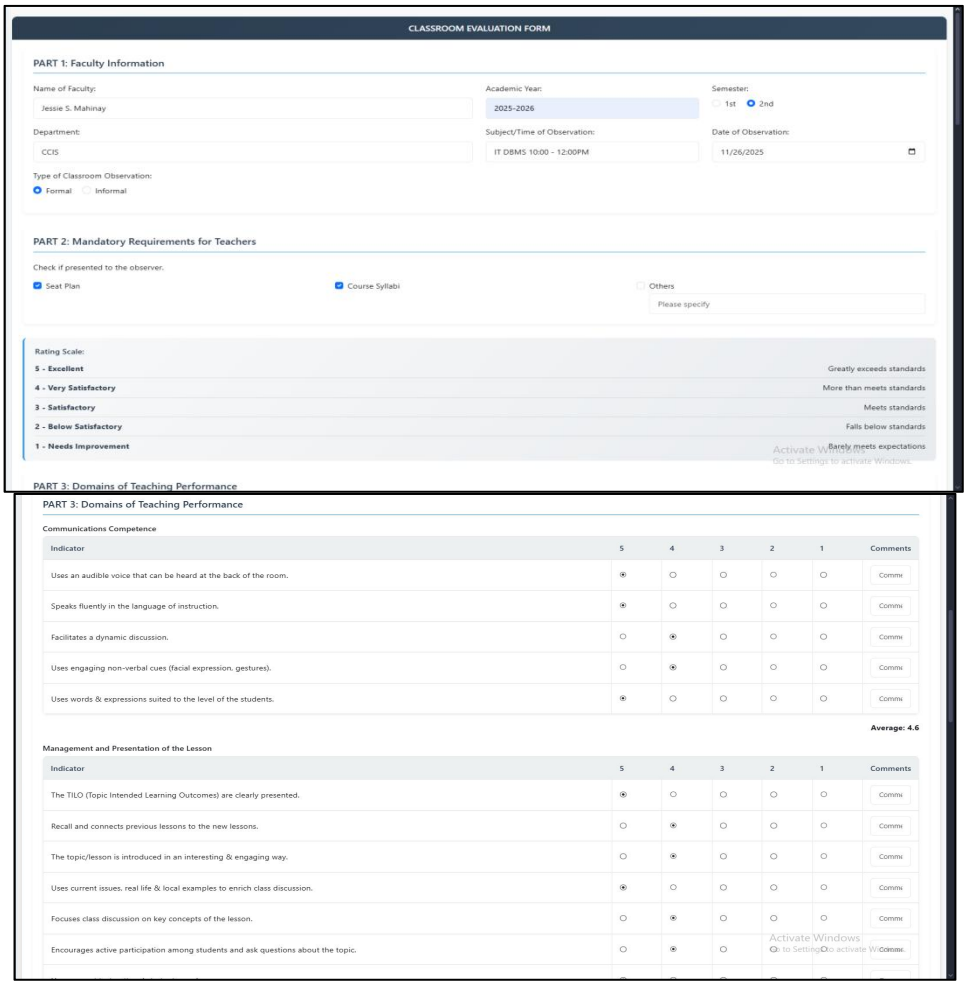

Figure 28: Faculty Dashboard - Evaluated Teacher View

This screen shows the faculty dashboard for teacher Jessie S. Mahinay from the CCIS department, who has been evaluated The screen displays teacher's active status, their following evaluation schedule (November 26, 2025, at 10:00 AM in Comlab 1), a record of past evaluations.

My Evaluation shows:

1. Date
2. Subject
3. Observer (President Rev. Fr. Ronniel G. Babano, STL)
4. Performance rating (Very Satisfactory – 4.3)
5. An option to view the complete evaluation form

This dashboard gives teachers a personal summary of their upcoming evaluations and past results.

Generate AI Recommendation

STRENGTHS

The instructor communicates technical concepts with clear, fluent language and effectively uses live coding demonstrations as teaching aids, ensuring key learning outcomes are understood.

AREAS FOR IMPROVEMENT

The lesson introduction needs stronger industry-specific applications to boost engagement, and student participation should be encouraged through more guiding questions while monitoring comprehension during demonstrations.

RECOMMENDATIONS

Start with an industry case study to frame the lesson, use quick comprehension checks during demonstrations, and integrate peer discussion of query results to deepen understanding.

AGREEMENT

The faculty member acknowledges the feedback provided in this evaluation. I agree with the assessment of my strengths in technical communication and the use of live demonstrations. I recognize the need to enhance lesson introductions with industry applications and to improve student engagement through guided questioning. I commit to implementing the recommended strategies, including using case studies and

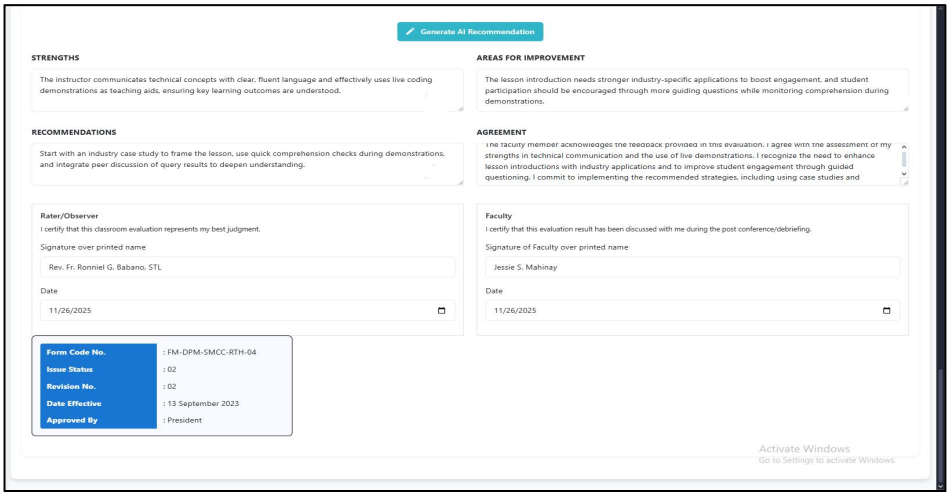

Figure 29: Teacher's View of Completed Evaluation Form

This screen shows the detailed evaluation form that teacher Jessie S. Mahinay can see. It appears after clicking the "View" button on their dashboard. This read-only version shows the complete assessment done by President Rev. Fr. Ronniel G. Babano, STL. It includes all ratings across three teaching areas:

- Communications Competence
- Management and Presentation of the Lesson
- Assessment of Students' Learning

These ratings led to the final **Very Satisfactory (4.3) ** score.

The form also shows:

- AI-generated strengths
- Areas for improvement
- Recommendations
- A formal agreement section with both signatures

the teacher review their complete evaluation results.

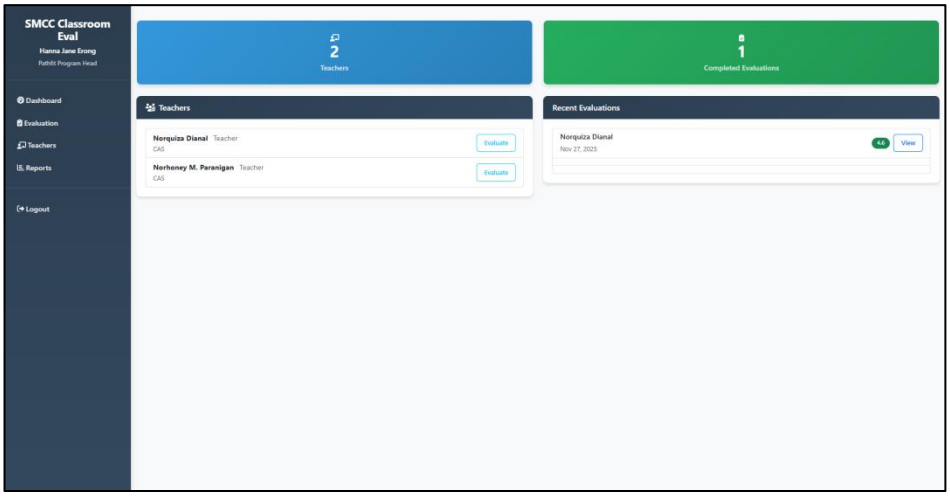

Figure 30: Program Head /Subject Coordinator Dashboard

This screen shows the dashboard for a Program Head or Chairperson (Hannah Jane Erong) in the CAS department. This special screen only lets the program head see and evaluate teachers in their own program. For example, they can view teachers such as Norquiza Dianal and Norhoney M. Paranigan who are assigned to their program.

The dashboard shows recent evaluation records and standard menu options. This gives the program head focused oversight of faculty in their specific program, not the whole department.

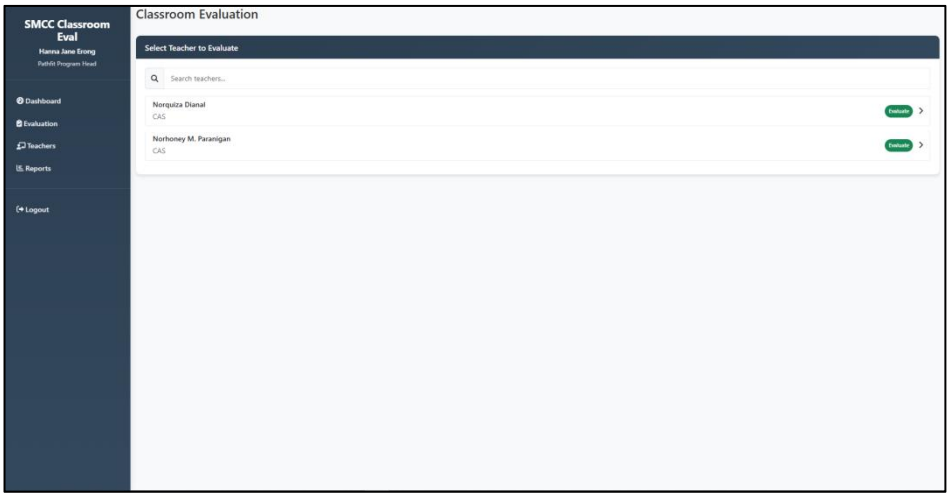

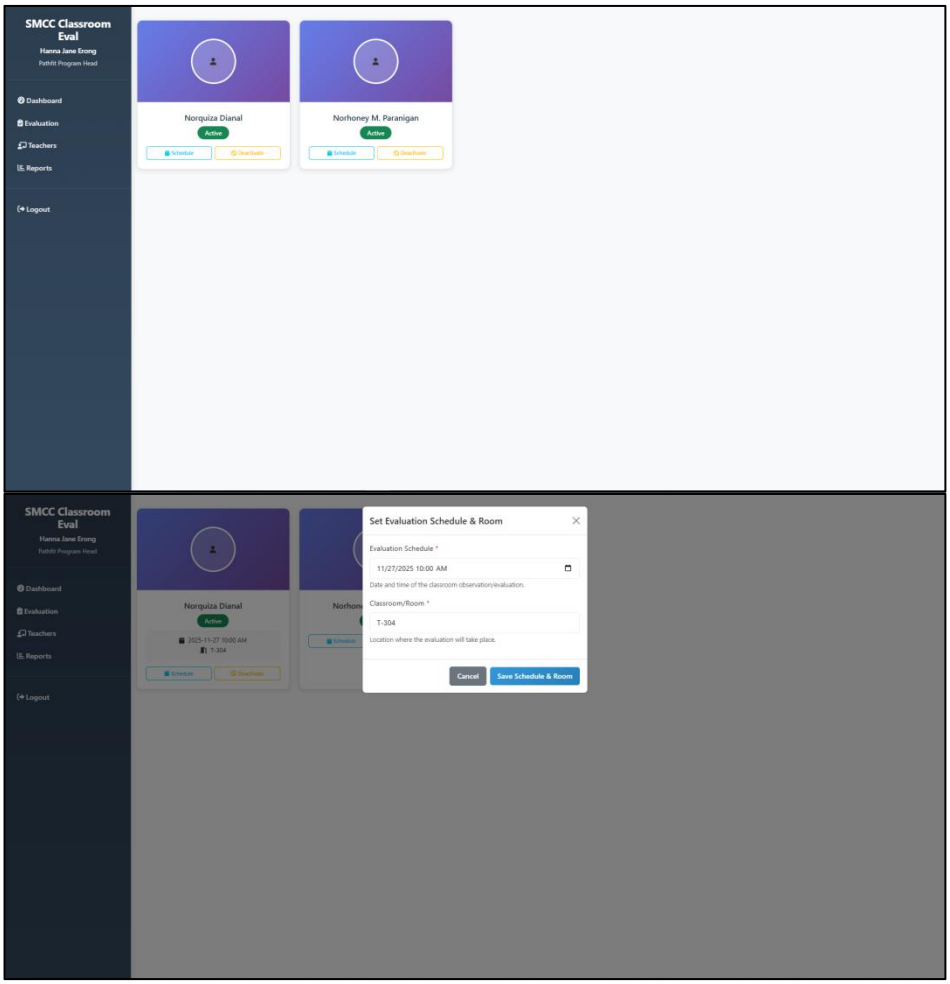

Figure 31: Program Head /Subject Coordinator - Teacher selection Interface

This screen shows the teacher selection page for a Program Head or Chairperson (Hannah Jane Erong). This special page is accessible only to teachers in their own program within the CAS department. It lists the available teachers for evaluation, such as Norquiza Dianal and Norhoney M. Paranigan. The screen includes a search bar and keeps the usual menu options.

This makes sure the program head can only evaluate and supervise faculty in their assigned program area.

Generate AI Recommendation

STRENGTHS

The instructor demonstrates excellent energy and clear communication, creating a motivating atmosphere for students. All exercises are demonstrated with precise form and proper technique, making it easy for students to follow along. The class maintains strong safety protocols throughout the session.

AREAS FOR IMPROVEMENT

The lesson could better accommodate students of different fitness levels by providing modified versions of exercises. More individual feedback on student technique during practice sessions would help improve their form and prevent injuries. The cool-down period should be more thorough to properly aid muscle recovery.

RECOMMENDATIONS

Implement differentiated instruction by demonstrating beginner, intermediate, and advanced variations for key exercises. Increase individual coaching during practice sessions to provide specific feedback on technique. Extend and structure the cool-down period to include comprehensive stretching for all major muscle groups

AGREEMENT

The faculty member acknowledges the feedback provided in this evaluation. I agree with the assessment of my strengths in energy, communication, and demonstration. I recognize the need to enhance differentiated instruction and individual feedback. I commit to implementing the recommended strategies, including exercise

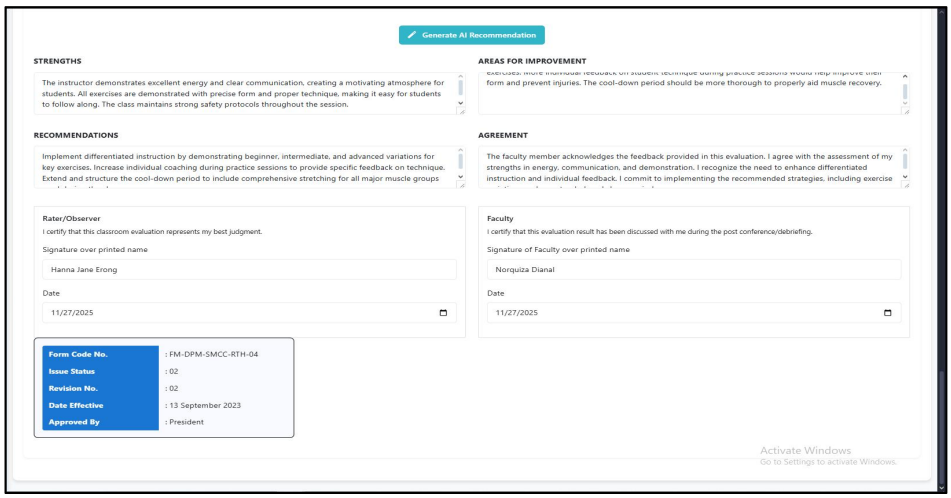

Figure 37: Teacher's View of Completed Evaluation Form

This screen shows the detailed evaluation form that appears when a teacher clicks "View" on their dashboard. This is a read-only version. It shows the complete evaluation of Norquiza Dianal, done by Hannah Jane Erong. It includes all ratings across three teaching areas, leading to a final rating of (Excellent 4.6). The form also shows an AI-generated feedback on strengths, areas to improve and suggestions. The formal agreement section is included, showing signatures from both the teacher and the evaluator.

Ethical Consideration

A. Protection of Intellectual Property Rights (IPR)

The researchers followed all the rules regarding Intellectual Property Rights (IPR) in accordance with the law of the Philippines (Republic Act 8293). They created all parts of the ADCES system, including the database structure, user interface, system design, evaluation steps, and AI feedback features. These are original works protected by Philippine copyright law.

The system uses open-source tools such as PHP, MySQL, JavaScript, and Bootstrap, all of which are used in accordance with their licenses. No paid software, templates, or copyrighted material is used without permission. All references, diagrams, and ideas from other authors are properly cited to avoid plagiarism. No patented or trademarked technology is used. The researchers ensured that all borrowed tools were used ethically and properly acknowledged.

B. Informed Consent

Participants were informed of the study's purpose, what they were required to do, and the minimal risks they could face. They read and agreed to the consent form before participating. They were assured that participation was voluntary and that they could withdraw at any time without penalty or any negative impact on their role, evaluation, or institution
al status.

C. Data Privacy and Confidentiality

The researchers complied with the Data Privacy Act of 2012 (Republic Act 10173). All personal information gathered during the development and testing of ADCES is kept confidential and used only for research and system improvement. Only the research team has access to the data. Digital files are stored in password-protected folders, while printed documents are stored in locked storage. Any information included in the reports is anonymized to protect individuals and departments.

D. Voluntary Participation and Freedom to Withdraw

Participation in the study was entirely voluntary. Administrators, evaluators, teachers, and other staff were informed that they could join or decline as they pleased. They were told they could stop participating at any time without penalty or impact on their job, evaluations, or professional standing.

E. Minimization of Harm and Risk Management

The study only focused on testing a digital evaluation system and did not conduct any hazardous or sensitive activities. An orientation was conducted before the test to help participants understand how to use the system. No sensitive personal data was collected, and no teaching records were altered. Participants can ask for help at any time and withdraw if they wish. Because no animals, biological processes, or medical procedures are involved, the 3Rs principle does not apply to this study.

F. Beneficence and Contribution to Knowledge

The study only focused on testing a digital evaluation system and did not conduct any hazardous or sensitive activities. An orientation was conducted before the test to help participants understand how to use the system. No sensitive personal information was collected, and no teaching records were altered. Participants can ask for help or withdraw at any time. Because animals, biology, or any medical procedures are not involved, the 3Rs principle does not apply to this study.

G. Justice and Fair Participant Selection

Participants were selected based on their role in the classroom evaluation process. No one was excluded based on gender, origin, position, or other personal traits. Selection focused on individuals who actively used the system to ensure meaningful feedback. This approach promoted fairness, avoided discrimination, and maintained balanced representation.

H. Data Integrity and Accuracy

To ensure accurate and reliable system data, researchers followed ISO 25010-based processes. Evaluation scores were entered using consistent digital forms to avoid errors. Automatic calculations such as averages and final ratings are double-checked. The researchers also analyzed the AI-generated feedback to prevent bias or misinterpretation. No AI was used to modify or create fake or modified numerical data. All records are securely stored, and any limitations of the study are honestly reported.

I. Transparency and Honesty in Reporting

All findings, data, and analyses were reported exactly as they occurred, without alteration. User feedback, test results, and AI outputs were recorded accurately. All tools and sources were cited correctly. Study limitations, such as sample size or technical restrictions, were openly discussed to preserve honesty and integrity.

J. Use of Patented or Copyrighted Materials

The development of ADCES fully complies with copyright and intellectual property laws. Only open-source or properly licensed materials are used. Tools such as PHP, MySQL, JavaScript libraries, and Bootstrap are used in accordance with their licenses. No patented technology or proprietary software is used without permission. All external icons, templates, and references are correctly referenced.

K. Considerations for Human Subjects

The study involved evaluators and teachers who tested the system. They were informed of the system's purpose, the nature of their participation, and the low risk involved. Participation is voluntary, and they can withdraw at any time. No sensitive personal information was collected, and all data were kept confidential in accordance with institutional guidelines.

L. Responsible Use of AI and Related Technologies

AI was used only to help generate, organize, and clarify text. It was not used to alter or create data that did not match the real system results. Researchers reviewed all AI-generated outputs to ensure accuracy and avoid bias. AI-supported documentation, but did not replace human judgment.

M. Ethical Clearance and Institutional Approval

The study obtained full ethical clearance and institutional approval before system development and testing. The IRB of Saint Michael College of Caraga reviewed the procedures to ensure compliance with ethical standards involving human subjects and data protection.

System Evaluation

The system was evaluated for functional suitability, performance efficiency, and usability. The survey instrument was adapted from ISO 25010 Software Product Quality Standards. Respondents rated the system on a 4-point scale, with 4 as the highest and 1 as the lowest.

Data were analyzed and interpreted based on the following parameters.

3.8 Software Platforms, Development Environment and Tools

Table 1

Software Platforms, Development Environments and Tools

Components	Specification	Usage
Internet Browser	Any	A web browser enables users to easily access and display content from the internet. It is responsible for loading the ISO IQA Management System's interface allowing users access to the system's features after a successful login.
Front-end	HTML	HTML defines the structural layout of the ISO IQA Management System's interface arranging elements like forms, texts, and other important elements.
	CSS	CSS is used for improving the aesthetics and designs of the HTML structure providing a more engaging and responsive website.
	JavaScript	To make the website interactive and provide more functionality for the users, JavaScript is used to handle all client-side functionalities.

	Bootstrap	Bootstrap allows developers to easily design responsive and mobile-first web pages by providing a collection of pre-designed components, grids, and styles to provide a more responsive website regardless of the screen size and device.
	Python	Python is a flexible and beginner-friendly programming language commonly used for back-end development. It helps handle the server-side processes of a system, such as managing data, running logic, and connecting the front-end to the database. Python is known for its clean syntax, making it easier for developers to write and maintain code.
Back-end	MySQL (Database)	MySQL powers data management by providing a robust database, allowing developers to store and manage information efficiently. By utilizing the interface of phpMyAdmin, developers can manage their databases and tables and can also perform queries.
	PHP	PHP is used on the server side which manages the interactions between user inputs and the database ensuring smooth data flow.

	FLAN-T5	FLAN-T5 is an instruction-tuned language model deployed as a backend service. The PHP backend sends evaluation data to the Python service, which generates strengths, areas for improvement, and recommendations. This allows the system to generate dynamic, accurate feedback without hard-coded responses.
Server	Apache	Utilizing the XAMPP control panel, developers can manage the behavioral state of its components ensuring smooth and easy access to local host servers like Apache and MySQL.

3.9 Hardware Requirements

Table 2

Hardware Requirements

Components	Specification	Usage
Device	RAM (16 GB)	RAM facilitates fast and temporary data storage. It is used to enhance the speed and performance of devices in accessing information.
	Processor (Intel Core i5)	The processor or the CPU, acts as the central component of the computer, handling the execution of instructions sent from the website. It also facilitates the processing of data.
	SSD (128 GB)	Devices employ SSD for storing large amounts of audit files, system software, and reports, while flash storage is commonly used in mobile devices for lightweight data storage. These storage solutions ensure quick retrieval and secure long-term data handling.
	Flash Storage (8 GB)	
Printer	Any Ink Jet Printer Units	Inkjet printers are utilized for printing audit reports, data summaries, and compliance documents, producing clear and high-quality output. These printers are versatile and affordable, making them suitable for regular printing tasks related to audit management, such as generating official documents for internal use or distribution to stakeholders.

Ethical Consideration

A. Protection of Intellectual Property Rights (IPR)

The researchers ensured that all parts of the AI-Driven Classroom Evaluation System (ADCES) strictly adhere to the principles of Intellectual Property Rights (IPR) in accordance with Republic Act 8293, or the Intellectual Property Code of the Philippines. All parts of the system—including the database structure, user interface design, system architecture, evaluation flow, and AI-generated feedback mechanism—were originally designed and developed by the researchers. As such, they are considered original works protected under Philippine copyright law. Open-source technologies such as PHP, MySQL, JavaScript, Bootstrap, and other libraries used in the development of the system are used in accordance with their respective licenses. No free or proprietary software, templates, or copyrighted material is used without permission.

All references, diagrams, literature, and ideas supporting the study are properly cited in the References section to acknowledge the original author and avoid plagiarism. No trademark is created or used, and the system does not use any commercial brand or patented technology. The researchers confirm that all borrowed concepts, tools, or frameworks have been used ethically, in accordance with license conditions, and with proper acknowledgment.

B. Informed Consent

Before beginning system testing and gathering feedback, the researchers ensured that all participants—including Deans, Principals, Chairpersons, Subject Coordinators, Teachers, and other academic staff involved in classroom evaluations—fully understood the purpose, goals, and scope of the study. They explained how their inputs, ratings, and interactions with the AI-Driven Classroom Evaluation System (ADCES) would help enhance the system's efficiency, accuracy, and user-friendliness. Participants received an Informed Consent Form that clearly detailed the nature of their involvement, the minimal risks associated with system testing, potential benefits, and the measures taken to safeguard their privacy and data. Participation was entirely voluntary. The researchers emphasized that participants could withdraw at any time without any negative impact on their position, role, or institutional standing. No data collection or system evaluation activities began until the participants signed the consent form. All information gathered—such as observations of their use of the system, evaluation inputs, and feedback—was used solely for academic research and system improvement. The study also clarified that the data collected would not be used for faculty ranking, employment decisions, or any formal administrative evaluations.

C. Data Privacy and Confidentiality

The researchers strictly adhered to the provisions of the Data Privacy Act of 2012 (Republic Act 10173) to ensure the protection, confidentiality, and proper handling of all information collected during the development and evaluation of the AI-Driven Classroom Evaluation System (ADCES). All personal data and information related to the evaluation—such as name, position, schedule, and evaluation inputs of participants—were treated as confidential and used only for system improvement and academic research. Access to the collected data is limited to members of the research team. Digital records are stored in password-protected folders and secure databases, while printed documents are kept in locked storage accessible only to authorized researchers. No personal information is shared, disclosed, or used beyond the scope of the study. Any data used in reports, discussions, or analyses is anonymized to prevent the identification of individuals or specific departments. The researchers ensured that no sensitive information was included in the final system demonstration or shared outside the institution without permission.

D. Voluntary Participation and Freedom to Withdraw

Participation in this study is completely voluntary. All participants—including Deans, Principals, Chairpersons, Subject Coordinators, Teachers, and other academic staff—are informed that their involvement in the AI-Driven Classroom Evaluation System (ADCES) assessment is not mandatory. Before participating, they are made aware of the study's purpose, the tasks involved, and the minimal risks related to system testing. The researchers clearly state that each participant has the right to withdraw from the study at any time without facing any punishment, negative consequences, or changes to their position, role, or institutional status. Their decision—whether to continue or withdraw—will not affect their employment status, evaluation results, or professional relationships.

E. Minimization of Harm and Risk Management

Since the study only involves using and evaluating a digital system for classroom assessment, it does not include any processes that could cause harm or require sensitive interventions. To ensure participants' safety and comfort, the researchers held an orientation before testing began. Administrators, evaluators, and teachers were instructed on how to use and navigate the system to avoid confusion, reduce stress, and ensure they had sufficient knowledge before using the platform. During testing, participants were also told they could ask for help or clarification at any time. No sensitive personal data were collected from participants aside from academic information authorized by the institution. Additionally, no teaching records were altered or misused. Participation was entirely voluntary, and the researchers ensured that participants could withdraw at any time without facing negative consequences or penalties if they felt uncomfortable. Since the study does not involve any processes related to animal

experimentation, biological methods, or medical intervention, there is no relevant risk or need to apply the 3Rs principle (Replacement, Reduction, Refinement).

F. Beneficence and Contribution to Knowledge

This study demonstrates clear benefits through the development of an AI-Driven Classroom Evaluation System (ADCES), which enhances the speed, accuracy, and fairness of faculty assessments at SMCC. The system assists administrators in generating organized reports and offers AI-generated feedback that supports teachers' professional growth. While participants may not see immediate personal gains, their involvement helps improve the institution's processes and educational quality. Additionally, this research contributes valuable insights into the application of AI in education and can serve as a resource for future researchers and designers of digital and intelligent evaluation systems.

G. Justice and Fair Participant Selection

Study participants were selected fairly based on their roles in the classroom evaluation process, including SMCC administrators, evaluators, and teachers. No one was rejected or excluded due to gender, origin, position, or any other personal characteristic. Selection was based on their actual involvement in using the system to ensure their feedback was meaningful and relevant. This approach maintained justice, avoided discrimination, and ensured fair representation throughout the research.

H. Data Integrity and Accuracy

To ensure the accuracy and reliability of all data in the AI-Driven Classroom Evaluation System (ADCES), the researchers followed standardized procedures aligned with ISO 25010. All submitted evaluation scores and information entered into unified digital forms to prevent errors and promote consistency. Automatic calculations—such as averages and final ratings—are thoroughly checked to ensure correct results. The AI-generated feedback (strengths, weaknesses, and recommendations) was used only as a guide and was carefully verified by the researchers to prevent misinterpretation or bias. No AI tools were used to alter or falsify the numerical data. All records are securely stored, and any limitations on testing or data volume are transparently disclosed. These measures help maintain the system's integrity, accuracy, and reliability of evaluation data.

I. Transparency and Honesty in Reporting

All data, analysis, and findings are published strictly based on actual results, without any manipulation, modification, or invention. The results of system testing, user feedback, and AI-generated outputs are precisely recorded according to the actual outcome. All sources, tools used, and references are properly cited. Any limitations—such as scope of testing, amount of data, or technical restrictions—are clearly acknowledged to maintain the integrity of the study. Following these principles, the entire report remains honest, accurate, and ethical.

J. Use of Patented or Copyrighted Materials

The development of the AI-Driven Classroom Evaluation System (ADCES) strictly follows copyright and intellectual property laws. Only open-source, free-licensed, or officially authorized materials are used to build the system. Frameworks, libraries, and tools like PHP, MySQL, Bootstrap, and JavaScript libraries are used according to their licenses. No patented technology or proprietary software is employed without proper permission. All external materials—such as templates, icons, reference studies, and online resources—are properly cited to acknowledge the original authors. The researchers made sure that no copyrighted material was copied, distributed, or modified in violation of existing law. This ensures legal compliance and academic integrity throughout the development process.

K. Considerations for Human Subjects

The study involved human participants, specifically evaluators and teachers who used the AI-Driven Classroom Evaluation System (ADCES) during testing and evaluation. All participants were informed of the system's purpose, the nature of their participation, and the very low level of risk involved. Participation was voluntary, and anyone could withdraw at any time without penalty. No sensitive personal information was collected except as necessary for system access and evaluation records. All participants' information was kept confidential and secure, following the institution's ethical standards and guidelines.

L. Responsible Use of AI and Related Technologies

The study used AI solely for generating, organizing, and clarifying texts; it was never employed to alter, manipulate, or create data that did not match the system's actual results. All AI-generated outputs—such as feedback, recommendations, and summaries—are carefully reviewed and verified by researchers to ensure accuracy and prevent bias. Additionally, AI was focused only on improving documentation and user experience, not replacing critical human analysis and decision-making. These measures preserved the integrity, ethics, and trustworthiness of the entire research process.

M. Ethical Clearance and Institutional Approval

The study obtained ethical clearance and permission from the institution before conducting the development and testing of the AI-Driven Classroom Evaluation System (ADCES). The Institutional Review Board (IRB) of Saint Michael College of Caraga reviewed all research processes to ensure that ethical standards were followed, especially regarding human participation, data protection, and responsible system development. No testing or participation was conducted until the study was officially approved.

System Evaluation

This section describes the different evaluation procedures performed on the system to assess its functional suitability, performance efficiency, and usability. The survey instrument is adapted from ISO 25010 Software Product Quality Standards; the test scale offers four options to respondents and will rate the system based on each question, with 4 as the highest and 1 as the lowest.

Data were analyzed and interpreted based on the following parameters.

Table 3

Functional Suitability

Adjectival Rating	Scale Range (Mean)	Verbal Interpretation
4	3.50 – 4.0	Very Functional
3	2.50 – 3.49	Functional
2	1.50 – 2.49	Moderately Functional
1	1.0 – 1.49	Poor Functional

Table 3 presents the criteria used to evaluate a product or system's functional suitability according to the ISO survey.

Table 4
Performance Efficiency

Adjectival Rating	Scale Range (Mean)	Verbal Interpretation
4	3.50 – 4.0	Very Efficient
3	2.50 – 3.49	Efficient
2	1.50 – 2.49	Moderately Efficient
1	1.0 – 1.49	Poor Efficient

Table 4 outlines the scoring parameters used to assess the system's overall performance efficiency in executing its functions and tasks.

Table 5

Usability

Adjectival Rating	Scale Range (Mean)	Verbal Interpretation
4	3.50 – 4.0	Very Usable
3	2.50 – 3.49	Usable
2	1.50 – 2.49	Moderately Usable
1	1.0 – 1.49	Poor Usable

Table 5 presents the scoring parameters used to the usability of the system.

Table 6

Respondent's Distribution

SMCC Learning Resource Center		
Position	**N (Population)**	**Percentage (%)**
Personnel	1	12.5%
Student	7	87.5%
Total	**8**	**100**

Table 6 outlines the distribution of respondents who participated in evaluating the system within the SMCC Learning Resource Center. The respondents are categorized based on their positions, with 12.5% holding personnel roles and 87.5% being students. This indicates that most feedback comes from students directly interacting with the system. Since they are the primary users, their insights provide a more accurate assessment of the system's functionality, efficiency, and usability in real-world scenarios.
