QUANTITATIVE RESEARCH DESIGN

I. OBJECTIVES

This study aims to determine the factors that influence the entrepreneurial intention of Business Management students of Saint Michael College of Caraga. It focuses on identifying their demographic profile, assessing key factors such as entrepreneurial knowledge, attitude, skills, experience, family support, and environmental and structural factors, and examining the relationship between these factors and the students' entrepreneurial intention.

II. METHODOLOGY

This chapter presents the research design, local research, respondents, research instrument, ethical standards, data gathering procedure, and statistical tool.

III. FINDINGS

IV. RECOMMENDATIONS

KEYWORDS: Entrepreneurial Intention, Entrepreneurial Knowledge, Entrepreneurial Experience, Personal Attitude, Family Support, Entrepreneurial Skills, Business Management Students

CHAPTER 1

THE PROBLEM AND ITS SCOPE

1.1 Background of the study

Entrepreneurial intention refers to an individual's cognitive state and motivation to establish a business venture. It is shaped by a combination of psychological traits, sociocultural factors, educational experiences, and environmental influences. These elements collectively determine how individuals perceive entrepreneurship as a viable career path and influence their willingness to pursue it (Shulman, 2025). Furthermore, community and institutional support play a significant role in strengthening entrepreneurial intentions by providing essential resources, mentorship, and opportunities for practical learning (Galay et al., 2023). When such support is limited, individuals may struggle to translate their intentions into actual business ventures (Anjum et al., 2023). In addition, hands-on experiences and exposure to real entrepreneurial ecosystems enhance confidence and readiness to start a business (Liñeiro et al., 2024). Comprehensive support systems such as training, incubation programs, and access to funding are crucial in transforming entrepreneurial intentions into successful ventures (Martins et al., 2023).

A comparative study conducted in Bangladesh and Saudi Arabia by Ukil et al. (2024) revealed that while entrepreneurial training and access to finance significantly influence intentions, contextual differences still lead to several gaps and issues in international studies. Furthermore, Anwar et al. (2024) noted that in India, there is a lack of longitudinal studies that track how entrepreneurial intentions develop into actual entrepreneurial actions over time. As supported by Roos & Botha (2022), in their study published in the South African Journal, there is an insufficient contextual analysis regarding entrepreneurial intentions across regions. It was also highlighted by Maheswari et al. (2022) in the study conducted in Malaysia that the significance of comparative

research that integrates contextual factors such as culture, policy environment, and economic conditions is to better understand variations in entrepreneurial intentions across countries.

Research across Mindanao shows a persistent gap between learning entrepreneurship in school and applying it in real ventures. In Iligan City, Navino (2020) found a clear disconnect between academic learning and real-life application. Similarly, Gaddi et al. (2024) in Surigao City identified limited capital, weak institutional support, and fear of failure as major barriers. In Davao City, Romero and Gono (2021) reported that students lack entrepreneurial readiness due to minimal hands-on learning and mentorship. In Bacolod, Yasay-Azucena (2025) emphasized that limited innovative and experiential learning prevents students from turning ideas into viable ventures. Likewise, Gonzales (2023) in Cagayan de Oro found that weak role models and limited real-world exposure reduce youth entrepreneurial motivation. Overall, these studies highlight structural, psychological, and institutional barriers affecting entrepreneurship in Mindanao. Addressing these persistent factors is not merely an academic exercise; it is a vital step toward regional economic development. By understanding and dismantling these barriers, the region can foster a robust entrepreneurial ecosystem. This, in turn, translates directly into local job creation, the establishment of new small and medium-sized enterprises (SMEs), increased local wealth, and a more diversified and resilient regional economy, ultimately contributing to Mindanao's sustained growth (UNDP, 2024; Nexford University, 2025).

In a study conducted in the Caraga Region, Berro and Bonotan (2024) found that Perceived Behavioral Control, which refers to an individual's belief in their own capability, was the strongest factor influencing entrepreneurial intention. This suggests that self-confidence in business-related skills plays a more critical role than general social pressure. Meanwhile, a study by Espanto et al. (2024) conducted in Butuan City, Philippines, revealed a significant relationship between parental

influence and career choices, highlighting that active parental support is the most effective form of influence.

However, Osei et al. (2022) found that gaps in the educational environment limit their ability to act on these intentions. Briones et al. (2023) found that despite students' positive attitudes toward entrepreneurship, universities still prioritize classroom learning over practical training and networking, limiting their entrepreneurial exposure. In addition, the study of Cano et al. (2022) indicated that to become successful in the field of entrepreneurship, one must possess a high level of entrepreneurial attitude and intention. As a result, Climent (2024) stated that many students, particularly those without family advantages, desire to start a business but lack the readiness and confidence to do so successfully.

This study addresses existing gaps by examining how various factors influence the entrepreneurial intentions of Business Management students in a private higher education institution (HEI) in Agusan del Norte (ADN). Although past research in Mindanao has explored similar topics, locally focused studies remain limited. Previous findings indicate that students often struggle to apply entrepreneurial concepts due to inadequate practical training, mentorship, and institutional support. Psychological factors such as confidence, risk tolerance, and motivation are also frequently overlooked, along with the lack of role models and networking opportunities that could strengthen students' drive to pursue business ventures. This study considers demographic variables such as age, sex, program, and entrepreneurial status, as well as entrepreneurial knowledge, personal attitude, skills, and family support. Moreover, environmental and structural factors, including strengths, challenges, opportunities, and risks, are also analyzed (Arrabaca III & Lumayag, 2024; Tepico et al., 2022). The findings aim to provide valuable insights for enhancing entrepreneurship education and developing strategies that better prepare students for success in pursuing business-related careers.

This study is significant to the College of Business and Management of Saint Michael College of Caraga as it can guide curriculum improvements that strengthen entrepreneurship education. By identifying factors that influence students' entrepreneurial intentions, the findings can help the college design programs that build students' skills, knowledge, and confidence in starting a business. For students, the study provides insights to enhance their entrepreneurial readiness and better apply their learning to future ventures. Ultimately, it supports the development of a stronger entrepreneurial mindset within the college community. For Policymakers (LGUs), the study offers empirical evidence on the barriers and enablers of youth entrepreneurship, which is crucial for formulating evidence-based local economic policies and developing targeted support programs (e.g., funding, tax incentives). For Local Business Organizations (e.g., Chambers of Commerce) to design more effective mentorship programs. By understanding students' readiness, the study helps these groups strengthen linkages between the academe and industry, ultimately fostering a more supportive ecosystem for new ventures and contributing to regional economic development.

1.2 Review of Related Literature

The related literature and studies on the entrepreneurial intention of Business Management students address the demographic profile. These will be examined in relation to the factors of entrepreneurial intention, including entrepreneurial knowledge, personal attitude, entrepreneurial skills, entrepreneurial experience, family support, and environmental and structural factors such as strengths, challenges, opportunities, and risks.

The realization of entrepreneurial intention is a key focus in business studies, recognized as essential for economic and social development (Sagar et al., 2023). This review synthesizes current research on the factors that influence students' readiness and decision to pursue entrepreneurship. The literature highlights that while entrepreneurial status and intention are strengthened by factors like self-efficacy, a positive personal attitude, and robust entrepreneurial knowledge and skills, significant gaps remain.

Success in entrepreneurship is not solely determined by theoretical understanding. Studies emphasize that a lack of practical entrepreneurial experience, limited family support, and persistent challenges, such as financial constraints and market uncertainties, frequently hinder the conversion of intention into actual business creation (Al-Fattal, 2025). Furthermore, while the recognition of opportunities is a vital motivator, the effective management of risk is often underdeveloped due to insufficient practical training, limiting its potential as a driver for innovation.

Ultimately, the literature confirms that although individual strengths and acquired knowledge build entrepreneurial potential, this potential often fails to translate into sustainable ventures without adequate institutional support, mentorship, and practical application. Therefore, this review aims to critically examine the interplay of these internal and external factors to identify strategies for effectively nurturing entrepreneurial spirit and action among students.

Entrepreneurial Intention

According to Zhuang & Sun (2025), entrepreneurship serves as a vital engine of economic development, yet the mechanisms translating entrepreneurial intention into behavior have gradually emerged. Individuals with strong entrepreneurial intentions are more likely to recognize opportunities, plan ventures, and exhibit innovation, resilience, and self-sufficiency, which are qualities vital for managing market challenges. For Business Management students, entrepreneurial intention reflects their preparedness to create jobs, strengthen local enterprises, and contribute to community development. Similarly, Etrata Jr & Raborar (2022) highlight that social networks and supportive environments stimulate entrepreneurial intentions, leading to sustainable business development and greater economic participation, especially in underperforming regions.

Domingo (2022) emphasizes that despite its significance, several gaps and challenges continue to hinder the realization of entrepreneurial intentions. While factors such as psychological traits, family background, and education influence entrepreneurial drive, barriers such as limited access to resources, lack of support, and negative perceptions persist. In line with this, Romero & Gono (2021) found that many entrepreneurship students in Mindanao experience fear of failure, inadequate startup capital, and insufficient mentorship, which discourage them from pursuing business ventures.

Testado (2021) also observed that creativity and a positive mindset foster entrepreneurial intention, whereas financial pessimism and fear of risk diminish entrepreneurial motivation among the youth in Bohol. Furthermore, Structural and organizational barriers intensify these challenges. Bureaucratic inefficiencies, weak policy support, and unstable institutional systems lower self-efficacy and heighten risk aversion among potential entrepreneurs.

Entrepreneurial Knowledge

According to Etrata Jr & Raborar (2022), entrepreneurial knowledge enables individuals to recognize opportunities, assess risks, and establish business ventures, which in turn strengthens their entrepreneurial intentions. Filipino Generation Z students who received entrepreneurship education became more business-minded, linking this to increased awareness, social value, and confidence. Perceived behavioral control also plays a vital role in the decision to become an entrepreneur, as it improves through knowledge gained from formal education, training, or observation. A deeper understanding of business planning, marketing, and financial management further increases the likelihood of viewing entrepreneurship as a viable and successful career path.

Fisher et al. (2021) emphasized that despite the recognized value of entrepreneurial knowledge, several issues and gaps continue to hinder its effectiveness in fostering entrepreneurial intention. While creativity, resilience, and problem-solving are key traits promoted by entrepreneurial education, many programs fail to translate these traits into practical competencies. Although entrepreneurship education boosts entrepreneurial intention, its impact often remains limited when experiential learning opportunities are scarce.

In addition, Añonuevo (2024) notes that while the Philippine government has made efforts to integrate entrepreneurship into higher education to enhance self-employment readiness, gaps remain in implementation. Although business programs are required to include entrepreneurship courses, many students still struggle to apply what they have learned in real-world contexts. Dondriano et al. (2025) found that students who engaged in feasibility studies, business planning, and local industry immersion were more likely to pursue entrepreneurship, indicating that applied learning is crucial. Nonetheless, when theory and practice fail to connect, misunderstandings occur, making it challenging to transform ideas into viable ventures. Moreover, Briones et al. (2023) assert that while entrepreneurial knowledge strengthens self-efficacy and opportunity

recognition, its impact is often weakened by inconsistencies in teaching methods and limited practical exposure. The quality of entrepreneurship education varies across institutions, with insufficient focus on real-world application and industry-specific challenges. These gaps hinder the development of a proactive entrepreneurial mindset, particularly among Business Management students who possess entrepreneurial knowledge but lack practical experience. To address these issues, improving training quality, mentorship, and experiential learning opportunities is essential to ensure that entrepreneurial knowledge effectively translates into sustainable business creation.

Personal Attitude

According to Valiente (2025), personal attitude plays a vital role in shaping entrepreneurial intention, as it influences how individuals perceive risks, identify opportunities, and evaluate their potential for success. Those who possess a positive attitude toward entrepreneurship are more likely to view it as an exciting and rewarding career choice. Similarly, Mauhay et al. (2023) explained that personal values, cultural background, and life experiences contribute significantly to the formation of entrepreneurial attitudes. A positive entrepreneurial mindset enhances confidence, resilience, and willingness to take risks, all of which are essential in managing the challenges associated with business creation and growth.

Passarelli & Bongiorno (2025), highlighted that despite the recognized importance of personal attitude, several gaps and challenges still affect its development among aspiring entrepreneurs. Although students with a positive outlook are more likely to pursue business ventures, many individuals still hesitate due to weak motivation or self-doubt. In relation to this, Laine et al. (2025)emphasized that while entrepreneurship education helps individuals recognize and seize business opportunities, its impact remains limited when it fails to address deeper factors such as personal beliefs and motivations. Taken together, these findings indicate that beyond knowledge and skills, personal attitude serves as the driving force that converts entrepreneurial

potential into concrete action. Nevertheless, limited mentorship, few role models, and inadequate exposure to real entrepreneurial experiences weaken the development of a proactive and confident mindset.

Furthermore, Albatran & Atikbay (2025) found that while many Filipino students view entrepreneurship as a path to independence and financial stability, this perspective is often constrained by fear of failure, limited access to resources, and societal pressure. Politus et al. (2025) also observed that family and cultural support can strengthen entrepreneurial spirit but may simultaneously foster risk aversion, discouraging individuals from exploring uncertain business opportunities. Similarly, Jardim et al. (2021) emphasized that even individuals equipped with entrepreneurial knowledge and skills may fail to act if they lack confidence and resilience. These findings reveal that personal attitude, though a powerful motivator, remains vulnerable to both internal doubts and external influences.

Entrepreneurial Skills

According to Grežo & Hanák (2024), entrepreneurial skills are essential abilities that transform innovative ideas into real business ventures. These include opportunity recognition, critical thinking, financial literacy, leadership, communication, and innovation, which can be grouped into four categories: technical capabilities, business management capabilities, personal entrepreneurial skills, and human relations skills. Domingo et al. (2023) further emphasized that these skills help students handle uncertainty, take calculated risks, and effectively manage their ventures.

However, while entrepreneurial skills strengthen confidence and provide practical tools for success, their development and application among aspiring entrepreneurs remain inconsistent. Despite the proven link between entrepreneurial skills and entrepreneurial behavior, many individuals struggle to apply these skills effectively in dynamic business environments (Agogbua &

Mgbatogu, 2024). Many students lack sufficient opportunities for hands-on learning through internships, simulations, and business competitions, which are crucial for developing practical competencies (Olalekan, 2024). Entrepreneurial skills are not innate but developed through education and experience. However, in many academic institutions, the absence of experiential learning weakens students' readiness to apply entrepreneurial knowledge in real-world situations (Pennetta et al., 2024).

In the Philippine context, Dotong & Manalang (2023) found that in Batangas, Filipino business students possess the potential to compete in the market and establish their own businesses; however, the effectiveness of entrepreneurial skills training remains limited. Innovation, adaptability, and problem-solving are vital for the success of micro and small enterprises, which form a large portion of the country's economy. Meanwhile, Lucas (2025)observed that in Metro Manila, higher education institutions still face significant gaps in developing these competencies due to limited exposure to real industry experiences. The lack of internships, business simulations, and industry linkages hinders students from transforming learning into practical entrepreneurial abilities. These gaps highlight the need for a stronger integration of experiential training and mentorship in entrepreneurship education to ensure that students across the Philippines can effectively apply their skills in actual business settings.

Entrepreneurial Experience

According to Dela Cruz (2023), entrepreneurial experience plays a vital role in shaping entrepreneurial intention because it provides individuals with the practical skills, confidence, and resilience needed to manage business operations effectively. The study, conducted in Manila, Philippines, revealed that Filipino students with microenterprise experience, whether gained through family businesses or internships, are more likely to pursue entrepreneurship, as such exposure bridges the gap between academic learning and real-world business practices.

However, the extent of this experience varies among students, which often leads to differences in readiness and confidence when engaging in actual entrepreneurial ventures. While entrepreneurship courses provide valuable insights, the lack of direct application and real-world exposure limits students' ability to identify opportunities and overcome early business challenges (Bignotia et al., 2022).

Moreover, Chan et al. (2025) emphasized that international studies consistently highlight entrepreneurial experience as a key factor in business success. Their findings revealed that practical engagement enables individuals to identify market needs and develop sustainable strategies, yet many educational systems still rely heavily on theoretical instruction. Campaner (2025)added that while hands-on methods such as incubators, simulations, and business plan competitions are proven to foster entrepreneurial spirit, access to these opportunities remains limited in many academic institutions. This lack of experiential exposure weakens students' technical, managerial, and decision-making skills, which are crucial for transforming entrepreneurial intentions into action.

Furthermore, Cano et al. (2022) found that individuals with prior experience in small or family-run businesses in Cebu City are more likely to pursue entrepreneurship compared to those without such backgrounds. Similarly, Capili & Bauyot (2024) discovered that working in microenterprises in Davao City enhances entrepreneurial competence but noted that institutional support and standardized training remain insufficient to provide consistent practical experience. Also supported by Zayas et al. (2024), a study conducted in Northern Mindanao further pointed out that the absence of structured entrepreneurial programs leads to unequal learning outcomes, where students with family business exposure gain an advantage over those without. These disparities highlight the ongoing gap between informal and formal entrepreneurial training in the country, showing that while experience strengthens entrepreneurial intention, unequal access to

practical opportunities continues to hinder the development of a strong entrepreneurial culture and limit the success of future entrepreneurs.

Family Support

Family support plays a crucial role in shaping entrepreneurial intentions by providing emotional encouragement, financial assistance, and strategic guidance that bridge the gap between intention and action (Dewi, 2024). In collectivist countries like the Philippines, families often exert more influence than peers, offering both emotional and material backing that enhances confidence, resilience, and willingness to engage in entrepreneurship (Haque et al., 2025). Cultural norms and strong family ties in regions such as Central Luzon further motivate students to pursue business paths, giving them stability and foundational support (Osei et al., 2022).

In contrast, according to Liu et al. (2022), a low family economic status can negatively moderate the effect of entrepreneurship education. Students from families with fewer resources may fear that starting a business will become a financial burden on their family, which in turn decreases their entrepreneurial intention. In addition, Xu et al. (2020) found that while family support can reduce financial stress, it can also amplify the relationship between workload stressors and negative well-being, suggesting it adds a layer of pressure. If such mutual obligations and expectations are not met, however, family embeddedness could lead to conflicts among family members and place resources at risk, which, in turn, exerts a negative impact on entrepreneurial processes and outcomes. The empirical studies have shown that family members' financial support is negatively related to entrepreneurs' startup decisions.

Furthermore, the role of the family in the entrepreneurial process is not always positive. In some cases, family dynamics can create obstacles and challenges for entrepreneurs. For instance, family conflicts can distract entrepreneurs from their business activities, and family responsibilities

can limit the time and energy that entrepreneurs can devote to their businesses. Negative family dynamics, such as conflicts, power struggles, and a lack of trust, can create a stressful and disruptive environment that can hinder the business's growth and success. Negative family dynamics can introduce substantial obstacles for family businesses' challenges, and disagreements among family members regarding the distribution of resources or the assignment of leadership roles can instigate conflicts detrimental to the business. Avoiding challenging conversations can lead to misunderstandings and a lack of trust within the family, which can negatively impact the business (Ajadi et al., 2023).

Strengths

According to Martins et al. (2023), entrepreneurial strengths, which include intrapersonal and psychological resources, are essential in transforming intention into entrepreneurial action. The Resource-Based View (RBV) highlights that internal capabilities such as creativity, leadership, resilience, and networking serve as vital assets in sustaining a competitive advantage. These personal strengths enable individuals to identify opportunities, handle challenges, and maintain persistence in their entrepreneurial pursuits. Similarly, Ngoa and Vua (2025) emphasized that international research supports the link between psychological capital and entrepreneurial performance. Attributes such as self-efficacy, proactiveness, and an internal focus of control strengthen motivation and persistence in entrepreneurship.

Additionally, Zayas et al. (2024) found that students' creativity and determination significantly enhance entrepreneurial intention, particularly in universities across Mindanao, where exposure to small family businesses helps develop leadership and interpersonal skills. Students who engage in microenterprise activities build strong management abilities.

However, despite their importance, many students lack structured opportunities to fully develop and apply these capabilities, revealing a gap between theoretical understanding and

practical execution. Many still fail to provide consistent psychological and strategic support. Further argued that although student strengths enhance entrepreneurial readiness, educational systems often do not capitalize on them effectively. This limits students' ability to transform their potential into sustained entrepreneurial activity, especially when confidence and initiative are not reinforced through practical experience (Liñeiro et al., 2024). The lack of institutional platforms such as incubators, mentorship programs, and industry linkages creates a gap between entrepreneurial potential and execution. Without adequate experience, guidance, and support systems, these students struggle to apply their strengths effectively in real business environments, hindering the conversion of entrepreneurial intention into actual ventures (Grace et al., 2025).

Challenges

According to Usman et al. (2024), entrepreneurial challenges are among the most significant barriers to venture creation, particularly for new entrepreneurs who struggle with limited funding, inadequate management skills, and market uncertainties. These constraints often slow business growth but can also strengthen entrepreneurial determination and adaptability. Similarly, Yukongdi & Cañete (2020) observed that even when mentorship and financial programs fail to provide full support, entrepreneurs develop resilience and a deeper understanding of business systems as they navigate bureaucratic inefficiencies. These findings suggest that while challenges can enhance persistence, systemic barriers continue to hinder the full realization of entrepreneurial intentions.

In addition, Romero & Gono (2021) pointed out that highly competitive markets and large capital requirements push students to explore niche opportunities and innovate beyond traditional industries. The GEM Global Entrepreneurship Monitor (2025)reported that fear of failure commonly reduces entrepreneurial intention, yet supportive ecosystems and peer networks can transform this fear into motivation. Financial, institutional, and psychological factors

such as resilience, strategic awareness, and proactive behavior strongly influence one's drive to pursue entrepreneurship. These insights underline the need to strengthen educational and mentorship programs that help aspiring entrepreneurs overcome fear, build confidence, and sustain motivation despite uncertainty.

In the Philippine context, Caliat (2024) found that young entrepreneurs face persistent challenges, including insufficient startup capital, limited industry linkages, and inconsistent government support, particularly in Metro Manila. Similarly, Orbeta & Corpus (2024) identified bureaucratic inefficiencies, weak market activity, and unstable local economies as significant constraints, particularly in provincial regions such as Northern Mindanao. While these challenges may foster resilience, they also lead many students to prefer stable employment over entrepreneurship. The lack of financial access, mentorship, and structural support continues to discourage entrepreneurial engagement. To address these issues, Romero & Gono (2021) emphasize the need for improved mentorship initiatives, financial literacy programs, and policy reforms to rebuild confidence and strengthen entrepreneurial intention among Filipino business management students in Mindanao.

Opportunities

According to Liñeiro et al. (2024), opportunities play a key role in shaping entrepreneurial intention, as they motivate individuals to transform potential into concrete action. These opportunities arise when new products, services, or processes can be created and sold profitably. Recognizing them requires cognitive ability, market awareness, and sensitivity to unmet consumer needs. Opportunity recognition thus acts as a vital link between internal readiness and external feasibility. Global findings reveal that both actual opportunities and how individuals perceive them strongly influence entrepreneurial intention. Moreover, Vamvaka et al. (2020) emphasized that entrepreneurship becomes an appealing and attainable career choice when perceived

opportunities are high. Nevertheless, Liñeiro et al. (2024) also noted that recognizing opportunities is a dynamic process shaped by experience, social networks, and adaptability. Similarly, Campaner (2025) found that supportive ecosystems in the Philippines, such as government programs and business incubators, empower students to capitalize on emerging business prospects. These studies highlight the need to strengthen opportunity recognition mechanisms and provide practical support for aspiring entrepreneurs to turn potential into sustainable ventures.

In addition, Cruz (2025) observed that young Filipinos are increasingly drawn to micro and small-scale enterprises as viable alternatives to traditional employment, contributing significantly to national economic activity. Likewise, Calindas (2024) emphasized that initiatives from agencies such as the Department of Trade and Industry (DTI) and the Commission on Higher Education (CHED) can stimulate innovation and entrepreneurial participation.

However, individuals who fail to identify such opportunities may hesitate to pursue entrepreneurship, even with adequate knowledge and skills. Despite these programs, systemic barriers persist. Bureaucratic inefficiencies, limited funding, and inadequate technological access continue to hinder opportunity utilization, particularly among students in rural regions such as Northern Mindanao. These constraints reveal a critical gap between entrepreneurial intention and actual execution. Further explained that the lack of structured support, practical learning opportunities, and innovation ecosystems weakens sustained entrepreneurial engagement. Addressing these limitations is essential to transforming opportunity recognition into successful entrepreneurial ventures among Filipino students (Kinao, 2022).

Risk

According to Karan (2024), risk is an inherent aspect of entrepreneurship and a critical factor influencing entrepreneurial intention. Entrepreneurs commonly encounter financial, market,

competitive, and operational risks, which require careful assessment and acceptance of uncertainty. Psychologically, a strong willingness to take risks distinguishes entrepreneurs from others. Similarly, Yin & Wu (2023) emphasized that perceived risk shapes entrepreneurial attitudes by affecting whether business ventures are viewed as feasible and desirable. Individuals with higher risk tolerance tend to be more business-oriented and exhibit stronger intentions to pursue entrepreneurial paths.

In addition, Caputo et al. (2025) noted that positively framed risk perception enhances entrepreneurial confidence and intention, as entrepreneurs often view risk as an opportunity rather than a threat. Lukeš & Zouhar (2025)further found that risk perception is closely linked to self-efficacy; individuals with greater confidence in their abilities are more likely to engage in entrepreneurial ventures despite uncertainties.

However, many students lack opportunities to develop risk management skills in real-world contexts, creating a gap between their willingness to take risks and their preparedness to handle them effectively. Educational programs and mentorship initiatives frequently fail to integrate practical risk-handling experiences. Students may understand risk conceptually but struggle to translate this awareness into action, limiting the impact of risk as a motivator for entrepreneurship. Many students perceive entrepreneurship as a response to financial instability rather than a deliberate career choice. Many prefer salaried jobs due to their perceived security and social acceptance (Saoula et al., 2023).

Government programs such as microfinance and business incubators help mitigate financial risks but face bureaucratic delays, limited rural access, and implementation gaps. Many students are unaware of or cannot utilize these resources, which weakens the potential for risk to act as a catalyst for innovation and growth. Addressing these limitations through targeted local programs

and practical interventions can help transform risk from a barrier into a key driver of entrepreneurial intention among Filipino business management students (Xu et al., 2020).

Age

According to Domingo (2020) age is a key demographic factor that influences entrepreneurial intention, as both younger and older students bring distinct strengths to starting new ventures. Younger individuals tend to be more creative, independent, and willing to take risks, which encourages early engagement in business activities. Mia et al. (2025) also noted that openness to new ideas enhances entrepreneurial self-efficacy and confidence, enabling younger students to participate actively in innovation and startups.

In contrast, older students may adopt more conservative entrepreneurial intentions due to family responsibilities and the perceived risks of starting new ventures. However, their greater experience, broader networks, and decision-making skills can contribute significantly to business success, supporting both necessity-driven and opportunity-driven motivations (Liñeiro et al., 2024; Martins et al., 2023).

In the Philippine context, Keoy et al. (2022) highlighted in their study conducted in Surigao del Sur that age interacts with employment opportunities and resource availability, as limited formal job opportunities encourage many young students to consider entrepreneurship. Nevertheless, younger students often face constraints such as limited capital, weaker social networks, and lower family support compared to older cohorts, who typically possess stronger financial skills and professional connections. These limitations can prevent young students from converting their innovative ideas and entrepreneurial aspirations into actual business ventures.

Thuy (2025) further emphasized that while mature students may have more resources and experience to start businesses, they may be less motivated due to financial stability and other responsibilities. Younger students, on the other hand, are more innovative and willing to take risks

but often lack access to mentorship, capital, and support. Despite these observable patterns, research on how age affects entrepreneurial behavior remains limited, particularly regarding its influence on entrepreneurial skills, attitudes, and organizational factors. Addressing this gap will help clarify the challenges and decisions faced by students at different life stages and guide the development of entrepreneurship programs that consider age differences while promoting inclusive and sustainable ventures.

According to the GEM Global Entrepreneurship Monitor (2025) entrepreneurs aged 18 to 24 are currently starting businesses at the highest rates, marking a shift from 1999 to 2021 when the most entrepreneurial activity occurred among the 25 to 34 and 35 to 44 age groups. This trend underscores the evolving influence of age on entrepreneurship and highlights the importance of age-sensitive education and support programs.

Sex

According to Sarwar (2021), the study of entrepreneurial intention (EI) among business management students frequently utilizes sex as a primary demographic determinant to understand how career aspirations are formed. In the academic setting, sex is considered a foundational variable because it influences how students internalize business curricula and perceive their future roles in the economy. Sex acts as a significant moderator in the Theory of Planned Behavior, affecting how personal attitudes and social pressures translate into the actual intent to start a business. This demographic lens allows researchers to identify specific patterns in career decision-making that are unique to male and female students within the business management discipline.

However, Islam & Alharthi (2024) note that the inclusion of sex in business research is crucial primarily because of the negative disparities and systemic barriers that continue to define the entrepreneurial landscape. Historically, women have faced a "gendered" business environment

characterized by restricted access to capital, lack of female role models, and persistent societal stereotypes that label entrepreneurship as a masculine pursuit. These negative external pressures often result in lower "perceived behavioral control" among female students compared to their male counterparts. This is a critical concern for researchers, as these perceived barriers can discourage high-potential students from pursuing business ventures, thereby leading to a loss of economic diversity and innovation

Despite these challenges, Xanthopoulou & Sahinidis (2024) found that contemporary research indicates that the gap in entrepreneurial intention is narrowing as educational interventions become more inclusive. When business management programs implement targeted entrepreneurial ecosystems, the initial differences in intention between sexes tend to diminish. Furthermore, Justus (2021) argues that entrepreneurship education (EE) provides a "leveling up" effect, where female students experience a more significant boost in self-efficacy and proactive personality traits than males. This suggests that while sex remains a crucial factor in identifying economic gaps, it is the quality of the academic environment that ultimately determines whether a student, regardless of sex, will successfully transition from intention to venture creation.

Program

According to Zayas et al. (2024), business programs in higher education institutions are paramount to foster entrepreneurship as they hone students' knowledge, skills, attitudes, and desires, which are essential for their success as future entrepreneurs. Business programs demonstrate that entrepreneurship education can strengthen both knowledge and mindset.

A study by Gerba (2022), published in the African Journal of Economic Management and Studies, found that students who completed entrepreneurship courses, particularly business management students, exhibited higher entrepreneurial intentions compared to those who had not taken such courses. This highlights the significant role of entrepreneurship education in

shaping students' attitudes, motivation, and readiness to engage in business activities. Furthermore, Dotong & Manalang (2023) emphasized that entrepreneurial attitudes, norms, and self-efficacy strongly influence the aspirations of young entrepreneurs. Micro, Small, and Medium Enterprises (MSMEs) in the Philippines constitute 99.6% of registered businesses and employ 62.8% of the workforce, underscoring the relevance of fostering entrepreneurial skills among students in programs such as Accountancy, Management Accounting, and Customs Administration.

Despite these benefits, Cuyos et al. (2025) observed that challenges remain in effectively integrating entrepreneurship across business management programs, such as BSBA-HRM and BSBA-FM, which can unintentionally limit entrepreneurial intention by emphasizing administrative or corporate roles over venture creation, innovation, and risk-taking. Bignotia et al. (2022) further noted inconsistencies in delivering entrepreneurship content, with many courses treating it as a minor topic rather than a core competency. Limited exposure to real-world experiences, mentorship, and practical training leaves students theoretically knowledgeable but struggling to start and manage their own ventures.

Entrepreneurial Status

Entrepreneurial status and intention are significantly affected as it determine students' exposure to current market trends, technology, and institutional support. students who immediately engage in entrepreneurial activities after completing their studies tend to exhibit higher self-efficacy, creativity, and resilience. Early business involvement allows them to apply academic knowledge to real-world settings, reinforcing confidence and adaptability. However, differences in training quality, access to resources, and students' support create gaps in how entrepreneurial engagement develops across cohorts (Xanthopoulou & Sahinidis, 2024).

Entrepreneurship is widely recognized as an important driver of economic and social welfare (Sagar et al., 2023). Opportunity recognition remains central to entrepreneurship definitions, while recent perspectives emphasize the dynamic process of innovation and creativity in business (Nambisan, 2022). Defining entrepreneurship as identifying, assessing, and exploiting opportunities to create goods and services (Venkataraman S & Shane Scott, 2020). Modern definitions extend to all types of enterprises, private, non-profit, and public, across all stages of development. This highlights the need to examine factors that either enable or hinder entrepreneurial success.

The time gap between graduation and starting entrepreneurial activities can reduce entrepreneurial intention. Students who delay business creation may experience declining motivation as they adjust to stable employment or personal responsibilities. Without continued exposure to entrepreneurial experiences, mentorship, capital, and professional networks, the creativity and excitement fostered during college tend to diminish. The lack of structured programs that sustain entrepreneurial interest often results in a preference for traditional employment over business creation (Cabanada et al., 2022).

Research confirms that businesses started by serial entrepreneurs (who start, exit, and then start another business sequentially) tend to last longer, implying that novice entrepreneurs (those starting their first venture) face higher failure rates (Shaw & Sørensen, 2022). This is often attributed to a lack of resources and practical experience. Novice entrepreneurs identified their main challenges as severe budget constraints, difficulty with customer identification, and digital marketing barriers, all stemming from "limited practical experience". These gaps underscore the importance of student programs that nurture entrepreneurial growth, ensuring that students remain capable and motivated to contribute to innovation and business development (Al-Fattal, 2025).

1.3 Theoretical Framework

This study, based on the Theory of Planned Behavior (TPB), was created by (Ajzen, 2020). It suggests that a person's intention in starting a business is influenced by three key factors: attitude towards the action, subjective norms, and perceived behavioural control. Intention shows as the leading cause of behaviour. The combined effect of these parts decides if a specific action will happen.

In entrepreneurship, attitude shows how a student views business creation as good and valuable. Subjective norms refer to the social pressures from family, friends, and society. Perceived behavioral control reflects how confident the student feels about managing entrepreneurial tasks and challenges. These ideas matter a lot for business management students. Their background in entrepreneurial education, family support, and resources can affect their readiness and choices. The Theory of Planned Behavior (TPB) in entrepreneurship research. It helps explain and predict entrepreneurial intentions, particularly among students and students. Many studies have used this framework. Notable examples include Bayona-Oré (2023) which focused on entrepreneurial intention among Peruvian university students, and Teoh et al. (2024) studied Entrepreneurial intentions among business students: The Malaysian case. All of them confirmed that TPB is essential for understanding how educational, social, and psychological factors affect entrepreneurial decision-making.

The TPB framework fits this research well as it shows how cognitive factors, like entrepreneurial knowledge and risk perception, and social influences, such as family support and cultural expectations, combine to shape entrepreneurial intention. students who have a favorable view of entrepreneurship, see strong social support, and trust their ability to handle business risks are more likely to show entrepreneurial intent.

1.4 Schematic Diagram

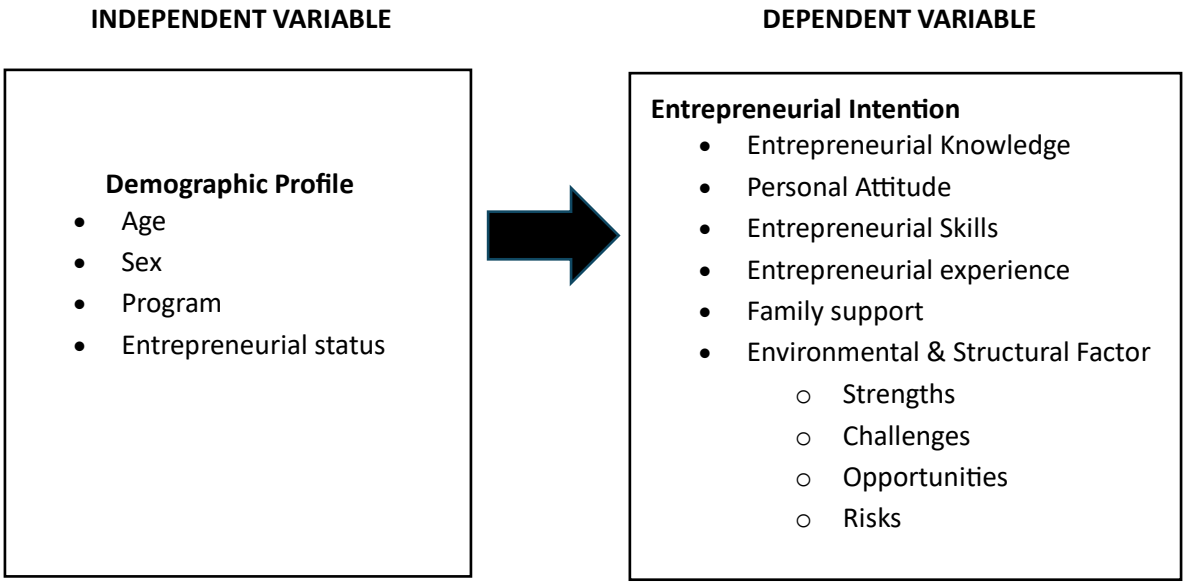

Figure 1. The Schematic Diagram shows the interplay between the Independent and Dependent Variables of the study.

1.5 Statement of the Problem/ Objectives of the Study

The study explores the factors influencing the entrepreneurial intention of business management students that shape their motivation and readiness to pursue entrepreneurial ventures.

Specifically, the study seeks to answer the following:

1. What is the demographic profile of the respondents in terms of:
   1.1. age;
   1.2. sex;
   1.3. program; and
   1.4. entrepreneurial status.
2. To what extent do the following factors influence the entrepreneurial intention of business management students in terms of:
   2.1. entrepreneurial knowledge;
   2.2. personal attitude;
   2.3. entrepreneurial skills;
   2.4. entrepreneurial experience;
   2.5. family support; and
   2.6. environmental and structural Factors.
      2.6.1. strengths;
      2.6.2. challenges;
      2.6.3. opportunities; and
      2.6.4. risks.

3. Is there a significant relationship between the demographic profile (age, sex, program, and entrepreneurial status) and the factors influencing entrepreneurial intentions of business management students of Saint Michael College of Caraga?

1.6 Null Hypothesis

Ho: There is no significant relationship between the demographic profile (age, sex, program, and entrepreneurial status) and the factors influencing entrepreneurial intentions of business management students of Saint Michael College of Caraga?

1.7 Scope and Limitations

This study is conducted at Saint Michael College of Caraga, Nasipit, Agusan del Norte, and focuses on the factors influencing the entrepreneurial intention of Business Management students. It includes 4th year students of BSBA majors in Financial Management, Marketing Management, Human Resource Management, and Bachelor of Science Entrepreneurship, selected through purposive sampling. The study uses a structured questionnaire adapted from previous research instruments studied by Tepico et al. (2022), entitled “Factors Influencing Entrepreneurial Intentions of Hospitality Mgt Students at OMS College”, and Arrabaca et al. (2024), entitled “Entrepreneurial Experiences of Students in an HEI in Northern Mindanao, Philippines”. To measure factors such as entrepreneurial knowledge, personal attitude, entrepreneurial skills, entrepreneurial experience, family support, and environmental and structural factors. It is limited to one institution and depends on self-reported data; therefore, the findings may not be generalized to other schools or contexts.

1.7 Definition of Terms

For a better understanding, the following terms are operationally defined as follows:

Age: Refers to the years of existence of the Business Management students of Saint Michael College of Caraga.

Business Management Students: Refers to students who have completed the Business Management programs at Saint Michael College of Caraga, and serve as the respondents of this study, equipped with knowledge and skills in organizing, leading, and managing business operations.

Challenges: Refers to the difficulties or obstacles that Business Management students at Saint Michael College of Caraga face in starting or maintaining a business.

Entrepreneurial Experience: Refers to the previous involvement in business activities, including internships, family businesses, or personal ventures of Business Management students at Saint Michael College of Caraga.

Entrepreneurial Intention: Refers to the Business Management students' plan or desire to start or engage in a business after finishing their studies at Saint Michael College of Caraga.

Entrepreneurial Knowledge: Refers to the Business Management students' understanding of business concepts and strategies gained through education and practice at Saint Michael College of Caraga.

Entrepreneurial Skills: Refers to the Business Management students' ability to apply decision-making, innovation, financial management, and leadership skills learned at Saint Michael College of Caraga.

Entrepreneurial Status: Refers to whether Business Management students at Saint Michael College of Caraga are currently involved or not involved in actual business.

Family Support: Refers to the financial, emotional, or motivational support received from families of Business Management students at Saint Michael College of Caraga to pursue business goals.

Sex: Refers to the biological classification of the respondents, categorized as Male or Female of the Business Management students at Saint Michael College of Caraga.

Opportunities: Refers to favorable market conditions or ideas identified as possible business ventures of Business Management students at Saint Michael College of Caraga.

Personal Attitude: Refers to the beliefs, mindset, and outlook toward pursuing entrepreneurship as a career of Business Management students at Saint Michael College of Caraga.

Program: Refers to the Bachelor of Science in Business Administration major in Financial Management (BSBA-FM), Bachelor of Science in Business Administration major in Marketing Management (BSBA-MM), Bachelor of Science in Business Administration major in Human Resource Management (BSBA-HRM), and the Bachelor of Science in Entrepreneurship (BS-ENTREP) offered under the Business Management department at Saint Michael College of Caraga.

Risks: Refers to the uncertainties or possible losses that Business Management students at Saint Michael College of Caraga face in running or planning a business, such as financial or operational risks.

Strengths: Refers to the personal abilities and qualities that Business Management students at Saint Michael College of Caraga developed through their education that help them in business.

CHAPTER 2

METHODOLOGY

This chapter presents the research design, local research, respondents, research instrument, ethical standards, data gathering procedure, and statistical tool.

2.1 Research Design

This study will employ a quantitative research design to objectively and systematically examine the relationship between selected demographic variables—namely age, sex, academic program, and entrepreneurial status—and the factors influencing entrepreneurial intention among students. The quantitative approach is appropriate for this study as it allows for the measurement, comparison, and statistical analysis of variables using numerical data gathered through a structured survey questionnaire. This design enables the researchers to identify patterns, trends, and relationships among variables, thereby producing results that are objective, reliable, and generalizable.

To ensure fair and adequate representation of the target population, a stratified sampling technique will be employed. The population will be divided into relevant strata based on academic program and sex among fourth-year students under the Business Management-related programs. From each stratum, respondents will be proportionately selected, which helps reduce sampling bias and ensures that key subgroups are appropriately represented. This sampling approach strengthens the validity of the findings and ensures that the participants are directly relevant to the study's focus on entrepreneurial intentions.

2.2 Research Locale

The study will be conducted at Saint Michael College of Caraga, situated in Nasipit, Agusan del Norte, within the Caraga Region.

Saint Michael College of Caraga (SMCC) is a Roman Catholic private school founded on July 1, 1948, with the help of Fr. Martin and Fr. Amadeo de Castro. A Secondary School was created to address the growing population of Nasipit. On February 16, 2002, the new school's name, Saint Michael College of Caraga, was launched as Mrs. Vanica P. Del Rosario suggested during the 1st SMI General Assembly. In 2002, Dr. Dennis P. Mausisa initiated Saint Michael College of Caraga Vision 2020 with its flagship program, "Magbayanihan Tayo," which consists of different pillars such as the Philosophy and Objectives, Faculty, Instruction, Laboratories, Research, Librarian, Library, Student Services, Social Orientation and Community Involvement, Physical Plant and Facilities, and the Organization and Administration.

Saint Michael College of Caraga was selected as the research locale because it offers a comprehensive Business Management program, providing majors in Financial Management, Marketing Management, Human Resource Management, and Entrepreneurship. The students' exposure to entrepreneurship courses, structured curriculum, and community-based programs under "Magbayanihan Tayo" make them ideal respondents for investigating factors influencing entrepreneurial intention. Additionally, SMCC's location in Nasipit, Agusan del Norte provides a localized perspective within the Caraga Region, aligning with the study's objective of understanding entrepreneurial intentions in a regional context.

2.3 Research Respondents

The respondents of this study are the students of selected programs from the Business Administration program of Saint Michael College of Caraga. The respondents are selected using the stratified sampling technique, focusing on students under the BSBA major in Financial Management, Marketing Management, Human Resource Management, and the Bachelor of Science in Entrepreneurship programs.

Table 1. Respondents of the Study

	POPULATION			SAMPLE					
	Male	Female	**Total**	Male		Female		**Total**	
	F	F	**F**	f	%	f	%	**f**	%
BSE	2	1	**3**	2	2.9	1	1.5	**3**	4.4
FM	5	45	**50**	4	5.9	37	54.4	**41**	60.3
MM	8	8	**16**	7	10.3	7	10.3	**14**	20.6
HRM	3	10	**13**	2	2.9	8	11.8	**10**	14.7
TOTAL	18	64	**82**	15	22.1	53	77.9	**68**	100.00

Table 1 shows the total number of respondents of 4th-year students at Saint Michael College of Caraga.

2.4 Research Instrument

The survey questionnaire used in this study is adapted from validated instruments employed in related research by Tepico et al. (2022), titled "Factors Influencing Entrepreneurial Intentions of Hospitality Management Students at OMS College," and Arrabaca et al. (2024), titled "Entrepreneurial Experiences of Students in a Higher Education Institution in Northern Mindanao, Philippines." The instrument is modified to align with the objectives and context of the present study.

To ensure content validity, the revised questionnaire undergoes expert validation by qualified faculty members with expertise in entrepreneurship, business management, and research methods, who evaluate the clarity, relevance, and appropriateness of the items. The recommended revisions are incorporated prior to data collection.

A pilot test is conducted among a small group of students who are not included in the final sample to assess the reliability, clarity, and comprehensibility of the questionnaire. The results of the pilot testing are used to further refine the instrument and ensure its suitability for the target respondents. The final survey questionnaire is structured and is divided into two main sections.

Part I. This contains the respondents' demographic profile, including information such as age, sex, program, and entrepreneurial status.

Part II. It contains the factors influencing entrepreneurial intention, particularly on aspects such as entrepreneurial knowledge, personal attitude, entrepreneurial skills, entrepreneurial experience, family support, and environmental and structural factors such as strengths, challenges, opportunities, and risks.

2.5 Research Ethical Standards

Through research protocols, the researchers comply with the guidelines.

A. Protection of Intellectual Property Rights (IPR)

To uphold academic integrity and the Protection of Intellectual Property Rights (IPR), the researchers instituted rigorous ethical standards. They ensured that all materials, ideas, and instruments utilized in the study were properly cited and acknowledged to give due credit to the original creators. Furthermore, a strict protocol was followed to avoid plagiarism, mandating that no part of any published work could be copied, paraphrased, or reproduced without the explicit consent of the author. To systematically manage this process and guarantee the accuracy of citations in accordance with established academic standards, the Mendeley citation software was employed to organize and verify all references.

B. Informed Consent

Before answering the survey, each respondent was clearly informed about the purpose and nature of the study. The researchers explained the goals and how the gathered information would be used. Each participant signed an informed consent form to show their agreement to join the study. They were told that their participation was voluntary and that they could stop at any time without any consequence. The researchers ensured that all participants fully understood their roles and responsibilities. The confidentiality of their answers was strictly protected to maintain privacy. All collected data was used only for academic purposes. These actions were done to follow ethical standards and protect the rights and freedoms of every respondent.

C. Data Privacy and Confidentiality

The privacy and confidentiality of all respondents were carefully protected under the Data Privacy Act of 2012 (RA 10173) in the Philippines. Personal information, including names and demographic details, was collected only with the explicit respondent's consent and remained

confidential. The information gathered was used only for academic and research purposes. All data collected were stored in a safe and secure place to prevent unauthorized access. Every response was treated with respect, honesty, and confidentiality.

After the completion of the study and the analysis of the data, all collected information will be properly disposed of to ensure the continued protection of respondents' privacy. Physical documents will be shredded, and electronic files will be permanently deleted from all storage devices. These actions were done to maintain ethical standards, protect the privacy of all respondents, and comply with the Data Privacy Act of 2012.

D. Voluntary Participation and Freedom to Withdraw

Participation in this study was entirely voluntary and based on the respondents' free and informed consent, despite the possibility that some participants may have been the researchers' classmates or seniors. To prevent any conflict of interest or undue influence, respondents were clearly informed that their decision to participate or decline would not affect their academic standing, grades, or relationship with the researchers in any way. They were given full autonomy to decide whether to take part in the study without pressure, coercion, or persuasion. Participants were also informed of their right to withdraw from the study at any point without penalty or justification. The researchers strictly respected each participant's decision throughout the data collection process and ensured that no attempt was made to influence continued participation. These ethical safeguards were implemented to ensure that participation remained honest, willing, and unbiased, thereby upholding the principles of ethical research conduct, fairness, and integrity.

E. Minimization of Harm and Risk Management

The researchers ensured that no participant was harmed or placed in an uncomfortable situation throughout the conduct of the study. The survey will be conducted personally by the researchers at Saint Michael College of Caraga or at agreed-upon locations where the respondents

are completing their On-the-Job Training (OJT), depending on the availability and preference of the participants. The questionnaire will be personally distributed and administered in person, and respondents will be requested to answer the survey on-site to ensure completeness and clarity of responses. Participation will be scheduled based on the respondents' availability, and prior consent will be obtained before the distribution of the questionnaire. Since the respondents are fourth-year students, many of whom are already engaged in OJT, the survey administration will be arranged in such a way that it will not interfere with their class hours or training schedules. Respondents will not be required to bring the questionnaire home, and sufficient time will be provided for them to answer comfortably without pressure.

All survey questions were carefully reviewed to avoid sensitive, offensive, or intrusive content, and the research process posed no physical, mental, or emotional risks to the participants. Throughout the study, respondents were treated with fairness, respect, and professionalism, and a calm and supportive environment was maintained at all times. The safety, well-being, and comfort of the participants were given the highest priority, in compliance with established ethical research standards.

F. Beneficence and Contribution to Knowledge

This study was carefully designed to be beneficial to students, teachers, and school administrators. The results aim to improve entrepreneurship education and inspire future entrepreneurs. The findings can also help schools create better programs for business management students. The researchers ensured that the study would bring positive contributions to the academic community. The information gathered will serve as a guide for improving teaching and learning in business-related fields. It also hopes to encourage innovation and the practical application of knowledge. The study was conducted to serve both education and society. These efforts were made to ensure that the research brings lasting value and meaningful impact.

G. Justice and Fair Participant Selection

The respondents were selected from Saint Michael College of Caraga using a stratified sampling technique. The population was first grouped into strata based on program, namely the Bachelor of Science in Business Administration (BSBA) majors in Financial Management, Marketing Management, and Human Resource Management, and the Bachelor of Science in Entrepreneurship program.

Included in the study were officially enrolled fourth-year students from the identified programs during the data collection period who provided informed consent. Excluded from the study were students from non-business programs, those in the first to third year levels, students not officially enrolled at the time of the study, and individuals who declined to participate.

This stratified approach ensured adequate representation of each program and enhanced the relevance, validity, and credibility of the data collected, while upholding ethical standards and objectivity.

H. Data Integrity and Accuracy

The researchers declare that no conflict of interest influenced the conduct, analysis, or reporting of this study, despite the possibility that some respondents may have been the researchers' classmates, seniors, or juniors at Saint Michael College of Caraga. To prevent bias, all data were collected, analyzed, and reported truthfully and objectively, without any alteration, fabrication, or selective omission of results. No data were changed or manipulated to favor any individual or outcome.

Transparency was strictly observed at every stage of the research process, and all findings were presented based solely on the actual responses provided by the participants. The researchers consciously avoided any form of personal, academic, or relational influence that could affect the

results. These measures were implemented to uphold research integrity, ethical standards, and the credibility of the study.

I. Transparency and Honesty in Reporting

All information in the study was presented clearly, honestly, and accurately. The researchers did not hide, exaggerate, or alter any part of the findings. Any challenges or limitations faced during the research were properly stated in the paper. This transparency helped make the study open, credible, and reliable. The researchers aimed to present only the true results based on the collected data. No bias or personal opinion influenced the interpretation of findings. Every detail was reported with fairness and sincerity. These actions were done to uphold honesty and integrity in the research process.

J. Use of Patented or Copyrighted Materials

The researchers respected all copyright laws by giving proper credit to the original authors of borrowed materials. No copyrighted content was used without the necessary permission from its creator. All books, studies, and research instruments were properly cited and listed in the references. This ensured that the intellectual property rights of the original authors were fully protected. The researchers followed the correct citation rules to avoid plagiarism. Every source used in the study was acknowledged with honesty and accuracy. These actions showed the researchers' commitment to ethical research practices. Following copyright laws helped maintain integrity and respect for the work of others.

K. Ethical Considerations for Animal and Human Trials

The study involved human participants; therefore, their rights and dignity were carefully protected at all times. All respondents were treated with respect, care, and fairness throughout the data collection process. The researchers ensured that no one was pressured, forced, or made to feel uncomfortable while answering the survey. Every participant's safety, comfort, and well-

being were given the highest importance. The study was conducted in a respectful and considerate manner to protect everyone involved. Fair treatment was strictly observed to avoid discrimination or harm. These actions helped create a safe and trusting research environment. The researchers followed ethical principles to show kindness, fairness, and respect to all participants.

L. Responsible Use of AI and Other Related Technologies

The researchers used technology and AI tools only to assist in editing, organizing, and citing references. These tools were never used to create false data or alter the study's findings. All final analyses, interpretations, and conclusions were made by the researchers themselves. The main purpose of using technology was to enhance the quality, accuracy, and presentation of the research paper. The researchers ensured that every tool was used properly and responsibly. No part of the study relied entirely on AI-generated content. Ethical guidelines were followed to maintain honesty and integrity in the research process. These actions showed the researchers' commitment to using technology ethically and professionally.

M. Ethical Clearance and Institutional Approval

Before collecting any data, the researchers first sought permission from their research adviser and the Saint Michael College of Caraga Research Ethics Committee. The study was conducted only after receiving official approval from the institution. This step ensured that all research activities followed the school's ethical standards and guidelines. Obtaining ethical clearance confirmed that the study was safe, responsible, and properly reviewed. The researchers strictly followed all institutional policies before starting the research process. This approval showed the researchers' respect for the school's authority and ethical procedures. Every action was done in accordance with academic and ethical requirements. These measures helped maintain the integrity and credibility of the entire study.

2.6 Data Gathering Procedure

The data gathering process is conducted systematically and ethically to ensure the accuracy, validity, and reliability of the study. With the Dean's approval, the researchers submit a formal letter of request to the Registrar's Office and the Development Office of Saint Michael College of Caraga to obtain permission for the conduct of the study and access to the list of fourth-year students enrolled in the BSBA programs (Financial Management, Marketing Management, Human Resource Management) and the Bachelor of Science in Entrepreneurship program. Using this list, potential respondents are identified according to the stratified sampling technique to ensure proportional representation based on program and sex. An in-person orientation is conducted to explain the purpose, scope, and procedures of the study, while emphasizing ethical considerations such as voluntary participation, confidentiality, anonymity, and the right to withdraw at any time without penalty. After orientation, the researchers personally distribute informed consent forms, allowing respondents sufficient time to read and voluntarily agree to participate. Once consent is obtained, the printed survey questionnaires are personally administered to respondents either at the Saint Michael College of Caraga or at agreed-upon locations during their On-the-Job Training (OJT), scheduled so as not to interfere with class hours or training responsibilities. The researchers remain present to clarify instructions and ensure that all responses are complete. Upon completion, the questionnaires and consent forms are personally collected and checked for completeness before being secured for data processing. Finally, the collected data are encoded, organized, and subjected to statistical analysis, with measures such as the mean used to summarize and interpret the responses in accordance with the objectives of the study.

2.7 Data Analysis Plan and Procedure

The following statistical techniques and methods will be employed to assist in presenting, analyzing, and interpreting the findings of the study.

Frequency and Percentage Distribution. The frequency and percentage distribution is used to determine how the respondents are distributed across demographic characteristics, specifically age, sex, program, and entrepreneurial status. This provides a clear profile of the respondents and helps identify patterns in the population that may relate to entrepreneurial intention.

Weighted Mean. The weighted mean assesses the factors affecting entrepreneurial intention of Business Management and Entrepreneurship students at Saint Michael College of Caraga. The factors considered include entrepreneurial knowledge, personal attitude, entrepreneurial skills, entrepreneurial experience, family support, and environmental & structural factors, which further encompass strengths, challenges, opportunities, and risks. The weighted mean allows the researchers to determine the extent to which each factor affects entrepreneurial intention, and to categorize responses into levels of effect (e.g., high, moderate, low), providing a detailed understanding of how these factors contribute to students' entrepreneurial mindset.

Pearson's Correlation Coefficient. Pearson's correlation coefficient is used to examine the strength and direction of the relationship between the demographic profile (age, sex, program, and entrepreneurial status) and the factors affecting entrepreneurial intention. This analysis determines whether specific characteristics are significantly associated with higher or lower entrepreneurial intention. The results provide insight into patterns and possible predictive relationships between demographic variables and entrepreneurial factors.

Dear Sir,

Christian Greetings!

We are the third-year students at Saint Michael College of Caraga, taking up Bachelor of Science in Entrepreneurship, and currently undertaking a thesis entitled **"Exploring the Factors Influencing Entrepreneurial Intention of the Business Management Students"** as part of our requirements for the Bachelor of Science in Entrepreneurship program.

We kindly request information from your esteemed office regarding the total list of BSBA and BSE in the College of Business and Management, 4th year Students of Saint Michael College of Caraga. This data will serve as a pivotal aspect of our study. We assure you that confidentiality is of the utmost importance, and all provided information will be handled with the highest level of discretion and confidentiality.

We eagerly anticipate your positive response to this inquiry. Your assistance in our academic pursuit would be immensely appreciated. Thank you for considering our request.

Respectfully,

QUEENIE C. JANIA

Dear Dr. Coraza,

Christian Greetings!

We are the third-year students at Saint Michael College of Caraga taking up the Bachelor of Science in Entrepreneurship. As part of our academic requirements, we are currently conducting our thesis entitled, **"Exploring the Factors Influencing Entrepreneurial Intention of the Business Management Students."**

In line with this, we are respectfully requesting your permission to conduct our study involving 4th year students from the College of Business and Management. This will include distributing and retrieving survey questionnaires that aim to gather data relevant to our research.

We assure you that the study will be carried out with utmost confidentiality, and all information collected will be used strictly for academic purposes only. Participation of the respondents will also be voluntary.

We sincerely hope for your favorable consideration of this request. Thank you very much for your support and assistance in our academic endeavor.

Respectfully yours,

QUEENIE D. JANIA

Direction: For each statement in the survey, kindly indicate how much you agree or disagree by checking (／) on the right side of every statement. There are no wrong or right answers. Your answer will be kept confidential. Thank you**.**

Scale	Description	Verbal Interpretation
1	**Strongly Agree**	The statement is **True** to the respondents all the time.
2	**Agree**	The statement is **sometimes true** to the respondents.
3	**Strongly Disagree**	The statement is **seldom true** to the respondents.
4	**Disagree**	The statement is **not true** to the statement

Entrepreneurial Intention				
Entrepreneurial knowledge	**4 Strongly Agree**	**3 Agree**	**2 Disagree**	**1 Strongly Disagree**
1. I can recognize potential business opportunities and evaluate the risks involved.				
2. I understand the basics of creating and planning a business, including marketing and financial management.				
3. I apply the concepts and skills learned from entrepreneurship classes in practical or real-life activities.				
4. I actively seek learning opportunities such as seminars, training, or mentorship to improve my entrepreneurial awareness.				
5. I feel confident that my entrepreneurial knowledge can help me successfully start and manage a business in the future.				
Personal attitude	**4 Strongly Agree**	**3 Agree**	**2 Disagree**	**1 Strongly Disagree**
1. I see entrepreneurship as a rewarding path that can provide independence and personal success.				
2. I believe I can overcome challenges and uncertainty when pursuing a business idea.				
3. I remain motivated to achieve my business goals even when I experience setbacks or self-doubt.				
4. I am willing to take calculated risks if they can lead to business opportunities and growth.				
5. I feel more encouraged to pursue entrepreneurship when I see successful entrepreneurs or receive support from others.				
Entrepreneurial skills	**4 Strongly Agree**	**3 Agree**	**2 Disagree**	**1 Strongly Disagree**
1. I can recognize business opportunities and create innovative solutions when challenges arise.				

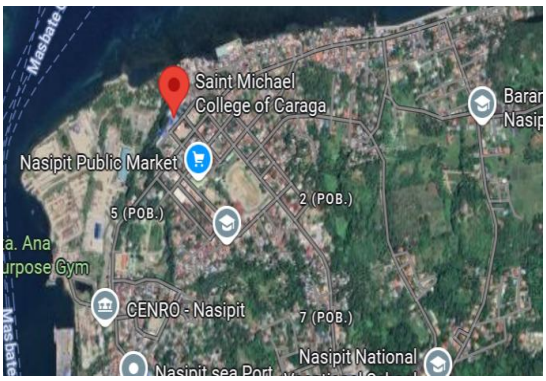

2. I use available resources efficiently to achieve my business or project goals.				
3. I can effectively plan and organize tasks needed to accomplish a business activity.				
4. I apply creativity and critical thinking when making business decisions.				
5. I can adapt quickly to changes and manage uncertainty in business situations.				
Entrepreneurial experience	**4 Strongly Agree**	**3 Agree**	**2 Disagree**	**1 Strongly Disagree**
1. I gain useful skills and knowledge from participating in business-related activities such as internships, family businesses, or school projects.				
2. I apply what I learned from my past business-related experiences when handling tasks or making decisions.				
3. I encounter challenges during business-related activities help me become more confident and resilient.				
4. I use my previous exposure to real business situations to adjust and improve when unexpected problems happen.				
5. I feel more ready to pursue entrepreneurship because of the practical experiences I have already gained.				
Family support	**4 Strongly Agree**	**3 Agree**	**2 Disagree**	**1 Strongly Disagree**
1. I receive encouragement from my family that boosts my confidence to pursue entrepreneurial activities.				
2. I receive useful advice or guidance from my family when making business-related decisions.				
3. I receive support from my family to participate in business activities such as internships, projects, or small ventures.				
4. I feel motivated to pursue entrepreneurship in the future because my family believes in my potential.				
5. I feel comfortable discussing business goals with my family because they try to help me succeed.				
Environmental & Structural factor				
Strengths	**4 Strongly Agree**	**3 Agree**	**2 Disagree**	**1 Strongly Disagree**
1. I take initiative in pursuing business ideas and opportunities.				
2. I feel confident in my ability to make sound entrepreneurial decisions.				
3. I can remain persistent and resilient when facing setbacks in business-related activities.				
4. I use creativity and problem-solving skills to handle challenges in business situations.				
5. I can work effectively with others and build positive relationships that support entrepreneurial activities.				

Challenges	4 Strongly Agree	3 Agree	2 Disagree	1 Strongly Disagree
1. I find it difficult to start or sustain business activities because I lack enough financial resources.				
2. I hesitate to pursue entrepreneurial opportunities because I am unsure about market competition and uncertainty.				
3. I feel overwhelmed handling business responsibilities because I still lack experience and confidence.				
4. I struggle to continue entrepreneurial activities when I cannot access mentorship or industry linkages.				
5. I lose motivation to pursue entrepreneurship when I fear making mistakes or failing in business.				
Opportunities	**4 Strongly Agree**	**3 Agree**	**2 Disagree**	**1 Strongly Disagree**
1. I actively look for unmet needs in the market that can become potential business opportunities.				
2. I feel confident identifying and evaluating business opportunities that could lead to successful ventures.				
3. I use my connections and networks to discover or explore new entrepreneurial opportunities.				
4. I apply what I have learned from past business activities to recognize future opportunities.				
5. I consider entrepreneurship a realistic career path when I see promising opportunities around me.				
Risk	**4 Strongly Agree**	**3 Agree**	**2 Disagree**	**1 Strongly Disagree**
1. I am willing to take financial risks to pursue a business opportunity I believe in.				
2. I view risk as a necessary part of entrepreneurship rather than a barrier.				
3. I feel confident in my ability to handle challenges and uncertainties in business.				
4. I am comfortable making business decisions even when the outcomes are uncertain.				
5. I believe that taking calculated risks can lead to growth and success in entrepreneurship.
