CHAPTER 1

THE PROBLEM AND ITS SCOPE

1.1 Background of the study

Stress is a regular part of life and often arises from responsibilities that require individuals to adjust to various demands at home, school, or work. In the teaching profession, stress is particularly common due to pressures related to personal responsibilities, societal expectations, administrative tasks, and instructional duties. Teaching is widely regarded as one of the most stressful professions, with high stress levels contributing to burnout and mental health concerns. As cited by Paril (2023), the teaching profession has one of the highest stress levels, resulting in an estimated 8% annual turnover rate among teachers. These challenges highlight the demanding nature of teaching and its impact on educators' well-being.

Globally, teachers play a vital role in students' learning and development. However, many educators experience significant stress that negatively affects both their health and job performance. According to G. and Shwetha (2025), teachers often experience anxiety, exhaustion, and reduced job satisfaction due to heavy workloads and high expectations. Supporting this, Magtalas (2024) and Nwoko et al. (2025) found that excessive responsibilities and role demands contribute to higher stress levels, burnout, and poor job performance. Consequently, schools play a crucial role in supporting teachers through trust, healthy working conditions, and effective leadership (Salvo-Garrido et al., 2025). Moreover, teachers can stay engaged and preserve their mental health with the assistance of schools, which includes trust, healthy work conditions, and effective leadership Salvo-

Garrido et al. (2025). Both emphasize that problematic student behavior, a heavy workload, and a lack of support are significant causes of teacher stress and burnout (Carroll et al., 2022; Suttles, 2024). It also points out that too many administrative tasks and insufficient preparation time are familiar sources of stress for teachers. According to Ferguson et al., (2022) teachers are often said to carry a heavy emotional burden as they must teach academic content and manage students' emotions. Burnout, emotional weariness, and a diminished capacity to provide for pupils might result from this strain (Agyapong et al., 2022). Hence, the development of strategies that promote teachers' well-being while maintaining professional effectiveness is essential (Ghasemi et al., 2023).

Although stress can at times be useful, it is harmful primarily when educators lack effective coping mechanisms. Coping skills can make the difference between burnout and resilience. Cervellione et al. (2025) found that building confidence, developing emotional skills, and practicing mindfulness can reduce teacher burnout and enhance resilience. Similarly, Pogere et al. (2019) emphasized that such practices contribute to maintaining positive and welcoming classroom environments. Teachers who use problem-focused coping strategies and receive autonomy support experience lower emotional exhaustion, whereas those who rely heavily on emotion-focused coping under excessive workloads are more likely to experience burnout (Chang et al., 2022).

In the Philippine context, teacher stress commonly stems from heavy workloads, large class sizes, limited resources, and insufficient administrative support. Magtalas (2024) identified paperwork, low salaries, student misbehavior, and high teaching loads as primary stressors among Filipino teachers. Likewise, Alson (2019) noted that overcrowded

classrooms and a lack of instructional resources negatively affect teachers' well-being. Due to these conditions, teachers often bring work home, further blurring the boundary between professional and personal life (Ancho & Bongco, 2019). Furthermore, Ausa (2023) highlighted the challenges faced by Generation X teachers in adapting to technology and ongoing educational reforms, emphasizing the importance of continuous professional development in reducing burnout. Emotional exhaustion has also been identified as a strong predictor of job dissatisfaction, reduced motivation, and teacher attrition (De la Cruz & Macalisang, 2024). Although Filipino teachers employ both emotion-focused and problem-focused coping strategies, research gaps remain. Most local studies are descriptive and cross-sectional, with limited focus on age-related differences and long-term coping outcomes (Lagos, MSLT, & Magallanes, 2020).

This study aims to identify the stressors and coping mechanisms of in-service teachers at Nasipit Central Schools, Nasipit, Agusan del Norte, as a basis for developing an intervention program. It will identify the main stressors teachers face at work, including increased workloads, job pressure, work environment, relationships with others, and technology demands. The research aims to help schools support teacher resilience, encourage healthy coping, and improve mental health and work-life balance. The goal is to increase teachers' motivation and effectiveness and raise the quality of education for students through an intervention program.

The findings can help teachers understand what causes their stress and become more aware of their relationships with school leaders, parents, and students. School administrators can use these results to build stronger support systems, such as training

and wellness programs, so teachers feel better prepared and more appreciated. When teachers are healthier and more resilient, they can teach more effectively and foster a positive classroom atmosphere. Students may also see what teachers experience, which could lead to better cooperation. For parents and the community, the results can draw attention to the difficulties faced by educators and generate additional support. Lastly, this research could be a useful resource for future researchers who want to learn more about teacher well-being and create programs that support the teaching profession.

1.2 REVIEW OF RELATED LITERATURE

This section presents a comprehensive and critical review of the existing literature on the stressors encountered by in-service teachers and the coping strategies they use to manage these challenges.

Teaching is widely recognized as one of the most demanding professions and is often associated with elevated stress levels that affect both teachers' mental health and classroom conditions. Stress may be a normal response when individuals face tasks beyond their capacity; however, when stress becomes excessive, it can lead to negative outcomes such as job dissatisfaction and impaired daily functioning (Emeljanovas et al., 2023). Several studies have identified common stressors affecting educators in the teaching profession. For instance, Cavallari et al. (2024) and Wettstein et al. (2021) reported that teachers frequently experience high levels of stress due to heavy workloads, extracurricular responsibilities, and continuous professional development requirements. These demands often place pressure on teachers' time, energy, and emotional resources. In addition to workload-related stressors, interpersonal and work–life challenges also contribute significantly to teacher stress. Longobardi et al. (2021) identified difficult work relationships and conflicts between professional and personal life as major sources of stress.

Similarly, Nappo (2020) emphasized that relationships with colleagues are closely associated with teachers' stress levels, while the overall school environment plays a significant role in shaping educators' stress experiences (Mugat, 2025). Moreover,

demographic factors have been found to influence stress among teachers. Variables such as gender, years of service, age, and employment status may affect how teachers experience and manage stress (Muhamad et al., 2023). These individual differences suggest that stress is not experienced uniformly across educators.

Consequently, prolonged exposure to these stressors can negatively affect teachers' productivity, well-being, and overall health. If left unmanaged, such stress may eventually lead to burnout, which further reduces teaching effectiveness and job satisfaction (Agyapong et al., 2022). In this literature review, various stressors, gathered from the findings of different research studies, affecting educators are being discussed such as poor working environment, work overload, student misbehavior, job demands, and demographic factors.

Teachers Stressor

Stress is a psychological state of tension that often arises in response to difficult or demanding situations. It is a natural response of the human body that enables individuals to adapt to and cope with various pressures. Because stress is part of everyday life, effective stress management is essential for maintaining overall well-being. Stressors that disturb homeostasis—whether physical or psychological—activate the body's stress response. Specifically, the neurological, endocrine, and immune systems interact to stimulate the sympathetic–adrenal–medullary (SAM) axis and the hypothalamic–pituitary–adrenal (HPA) axis (Chu Brianna, 2025).

Several studies have examined how stress manifests in high-pressure professions such as teaching. Stress in this context often results from multiple and overlapping factors. Moreover, stress occurs as a response to specific stressors that trigger psychological and emotional reactions. Wahab et al. (2024) stated that when stress is not effectively managed, individuals may experience difficulty communicating with others in both professional and personal settings. Similarly, Emeljanovas et al. (2023) emphasized that teaching is a highly demanding and stressful profession that frequently leads to anxiety, reduced well-being, and job dissatisfaction.

As a result, teachers tend to rely on coping strategies to manage both the causes and effects of stress. Pagulong and Bulilawa (2021) defined coping as the cognitive, emotional, and behavioral efforts individuals use to handle internal and external pressures. According to the same study, effective stress management significantly influences the level of stress experienced by individuals. Importantly, people may respond differently to the same stressor depending on their coping mechanisms and personal resources. In line with this, Agyapong et al. (2022) highlighted that stress associated with teaching is closely linked to three overlapping concerns: depression, anxiety, and burnout. These conditions negatively affect teachers' health, emotional well-being, and productivity. Such findings reinforce the idea that coping strategies play a crucial role in shaping individuals' stress responses. Pagulong and Bulilawa (2021) further found that job stressors significantly affect work efficiency, noting that frequent exposure to stressors is associated with lower productivity, as employees tend to perform poorly under prolonged stress.

In the educational context, teaching has been identified as a highly stressful profession with wide-ranging consequences. According to Wettstein et al. (2021), teacher stress not only affects educators' health but also has implications for student outcomes and broader economic concerns. However, stress can be mitigated through institutional support. School administrators can help reduce teacher stress by fostering supportive and healthy work environments (Pagulong & Bulilawa, 2021). Furthermore, teaching experience has been identified as an important factor influencing stress levels. Pagán-Garbín et al. (2024) found that teachers with fewer than five years of experience were more likely to experience anxiety than those with more than twenty years in the profession. Their findings indicated that teaching experience was a stronger predictor of psychological distress than age. In particular, generalized anxiety disorder (GAD) was found to be 3.6 times more prevalent among younger teachers, largely due to unfamiliarity with workload demands, lack of routine, and limited coping skills.

Consistent with these findings, Cabaguing (2022) reported that public elementary school teachers frequently experience stress due to a poor working environment, work overload, and student misbehavior. These challenges increase stress levels and hinder teachers' ability to perform their duties effectively. Likewise, Skaalvik et al. (2018) identified increased job demands as a major source of stress, noting that teachers often feel overwhelmed by multiple responsibilities, heavy workloads, and constant time pressure.

Poor Working Environment

A poor working environment is a common source of stress among teachers. According to Cabaguing (2022), the work environment includes physical, psychological, and non-physical aspects of the workplace. Teachers tend to be more motivated and capable of fulfilling their responsibilities when they work in a positive environment characterized by supportive relationships and fair management practices.. The physical environment of schools plays a significant role in shaping teachers' experiences. Wong (2020) described the work environment as the physical setting in which teachers perform their duties, including classroom and staff room size, availability of rest areas, school facilities, campus cleanliness, and air quality. These physical conditions strongly influence teachers' comfort, productivity, and overall well-being.

However, many teachers experience stress due to unsafe working conditions and a lack of instructional resources. Alson (2019) reported that insufficient teaching materials and increased administrative monitoring place additional pressure on teachers. Similarly, Maffea (2020) noted that managing classes with 20 to 30 students daily presents considerable challenges, particularly when teachers must address diverse learning needs while working with limited resources. As a result, these persistent difficulties may reduce teachers' motivation and enthusiasm for their work.

Moreover, environmental conditions within schools can further intensify stress. Mugat (2025) found that excessive heat in school environments was a major contributor to physical stress among teachers, emphasizing the importance of maintaining comfortable and conducive working conditions. This issue is particularly evident in the

Philippine context, where teacher stress arises not only from student-related concerns but also from unfavorable school conditions (Mugat, 2025). The high number of students in public schools further compounds these challenges. Consequently, many teachers are unable to complete academic tasks during school hours. As a result, they often bring work home, such as grading and reviewing assignments, which blurs the boundary between professional and personal life (Ancho & Bongco, 2019). In the same study, Mugat (2025) reported that among various stressors, poor physical school conditions had the most significant impact on teachers, with excessive heat identified as the primary factor contributing to physical environmental stress. In addition, a poor working environment has been associated with mental health concerns. Peele and Wolf (2020) reported that unfavorable work conditions are linked to higher levels of anxiety and depression. Supporting this, Agyapong et al. (2022) emphasized that increasing working hours and responsibilities raise job demands, which may eventually lead to stress-related anxiety and depression among teachers.

Beyond physical conditions, the social or non-physical aspects of the work environment also contribute to teacher stress. Nappo (2020) noted that teachers who maintain positive relationships with colleagues tend to remain productive and successful even under high stress. Cooperation and supportive relationships in the workplace reduce the likelihood of stress-related burnout.

Conversely, teachers who experience communication difficulties with parents or unresolved conflicts with colleagues are more likely to suffer from burnout (Tikkanen et al., 2022). Similarly, Vermote et al. (2022) found that teachers who felt greater social

pressure from students or coworkers reported lower job satisfaction and higher levels of frustration.

Work Overload

According to Cabaguing (2022), teachers experience work overload due to extended working hours, frequent changes in responsibilities, and the demands of a continuously evolving curriculum. These factors significantly increase stress levels and negatively affect teachers' overall well-being and professional performance.

Teachers play a critical role in promoting learning and improving educational outcomes. However, excessive workload limits their ability to perform their primary teaching duties effectively. Tarraya (2023) found that heavy workloads negatively affect teachers' personal lives, professional performance, mental and physical health, and even student outcomes. As a result, teachers often struggle to balance instructional responsibilities with additional tasks. Moreover, professional development requirements further contribute to teachers' workload. Osorio Vanegas et al. (2025) emphasized that teachers must be trained in 21st-century skills and the effective use of digital technologies to enhance teaching and learning. While such training is necessary, it adds to teachers' responsibilities. Supporting this, Max et al. (2022), as cited in Osorio Vanegas et al. (2025), noted that many educators experience pressure from heavy workloads, asynchronous teaching, and difficulties in managing information. These findings highlight the importance of workload management in addressing the growing complexity of teaching.

The quality of education largely depends on teachers' mental well-being. Thus, it is essential to consider the factors that influence teachers' well-being (Yudhistira et al., 2025). However, many teachers report experiencing high levels of stress due to excessive workload, including lesson planning, grading, extracurricular activities, and professional development requirements. Excessive perceived stress has been shown to negatively affect teachers' well-being and the quality of education they provide (Cavallari et al., 2024; Wettstein et al., 2021). In the Philippine context, Mugat (2025) identified heavy workload as the primary stressor among public school teachers.

Additionally, frequent curriculum changes place further pressure on teachers. As curricula vary across educational levels and are regularly updated, teachers must revise lesson plans and instructional strategies to meet national standards. This process increases workload and intensifies time pressure (Zhao et al., 2022). Soria (2022) further reported that teachers often feel rushed when balancing lesson preparation with grading responsibilities. In addition, Hahn et al. (2025) found that high academic demands are associated with increased perceived stress, reduced engagement, and higher dropout intentions among teacher education students

Furthermore, teachers are often burdened with non-teaching responsibilities. Wahab et al. (2024) stated that educators are overloaded with both teaching-related and administrative tasks, many of which they are not trained to handle. Consequently, teachers frequently bring work home to complete unfinished tasks. Despite teaching being their primary responsibility, teachers are also expected to serve on committees and submit numerous reports and documents to school administrators (Krishnan, 2022).

In addition to workload volume, work conditions also influence stress levels. Longobardi et al. (2021) reported that teachers experience stress due to excessive workload, time constraints, lack of autonomy, work–life conflict, insufficient compensation, and inadequate benefits. Similarly, Qin (2024) emphasized that teachers face stress when meeting curriculum requirements, preparing students for standardized assessments, and addressing the diverse needs of students.

According to the Job Demands–Resources Theory, an imbalance between job demands and available resources leads to stress and burnout (Camacho et al., 2021). The expectation that teachers must "do it all" without sufficient support creates an additional emotional burden, often resulting in frustration and feelings of inadequacy. Moreover, managing diverse classrooms with varying student behaviors and emotional needs further intensifies teachers' stress (Blessing, 2024). Such conditions limit teachers' ability to focus on both individual students and their own psychological well-being.

Student Misbehavior

Student misbehavior has been identified as a significant contributor to teachers' personal and professional stress. Will (2023) found a direct relationship between increased student misbehavior and heightened stress levels among teachers. Similarly, Cabaguing (2022) identified student behavior issues as one of the primary sources of stress in the teaching profession. Disruptive behaviors, such as persistent mischief and difficulty maintaining classroom discipline, often overwhelm teachers and increase emotional strain. Moreover, repeated exposure to student misbehavior is strongly associated with

teacher burnout. Vidić et al. (2021) reported a positive relationship between student misbehavior and teacher burnout, indicating that teachers who frequently manage disruptive behaviors are more likely to experience emotional exhaustion.

The manner in which teachers manage classroom behavior also greatly influences the learning environment. Palma (2022) emphasized that classroom management plays a critical role in maintaining a positive and productive learning atmosphere. Common forms of student misbehavior include the use of inappropriate language, bullying, inattention, and aggressive behavior. These behaviors not only disrupt instruction but also negatively affect student learning outcomes and teaching effectiveness. In addition, Pelo et al. (2023) found that persistent disruptive behavior harms student–teacher relationships and negatively impacts students' academic performance, motivation, and focus. When misbehavior becomes continuous, it creates a challenging classroom environment that further increases teachers' stress levels.

Furthermore, Kollerová et al. (2023) emphasized that regular exposure to disruptive student behavior is a major contributor to teacher burnout and emotional exhaustion. Teachers who frequently deal with classroom misbehavior tend to report higher stress levels and lower job satisfaction compared to those who encounter fewer behavioral issues. However, the study also highlighted that supportive school leadership can mitigate these negative effects, reducing the impact of student misbehavior on teachers' well-being.

Job Demands

According to Skaalvik et al. (2018), job demands are identified as strong predictors of reduced teacher well-being. The demanding nature of teaching often blurs the boundary between professional and personal life, contributing to prolonged stress.

Similarly, Blessing (2024) emphasized that many teachers extend school-related work into their personal time, such as grading assessments at home. This practice compromises personal time and negatively affects teachers' overall well-being. Teachers consistently experience high stress levels due to the physical and mental energy required to manage classroom activities, instructional responsibilities, and diverse student needs.

In addition to professional demands, teachers face pressures arising from personal and familial obligations. Emeljanovas et al. (2023) and Khalifa et al. (2022) noted that the evolving nature of work environments, rapid social changes, increasing use of digital technologies, and the responsibility of teaching students with special needs have heightened expectations placed on educators. These combined demands further intensify teachers' stress levels.

Moreover, workload distribution also contributes to increased stress. Kambli et al. (2025) reported that teachers are often assigned additional responsibilities beyond their regular duties, many of which must be completed under tight deadlines. Consequently, teachers struggle to balance professional and personal responsibilities. The shift toward online and hybrid learning environments has further complicated this balance. The online

format of courses, work-from-home arrangements, and constant connectivity blur physical, temporal, and mental boundaries between home and school, making it more difficult for teachers to disengage from work-related tasks.

Furthermore, several studies have shown that conflicts between work and family roles make it challenging for individuals to manage dual responsibilities, often leading to job burnout (Ji & Yue, 2020). As a result, persistent job demands may reduce job satisfaction and commitment while increasing stress, anxiety, and the risk of depression or burnout (Emeljanovas et al., 2023). These conditions pose serious risks to both physical and mental health.

Coping Mechanism

Coping with stress refers to the process by which individuals manage stressful situations and the emotions they evoke through cognitive, emotional, and behavioral efforts. These strategies are not fixed but continuously change depending on the situation and the individual's capacity to respond. Voitenko (2021) explained that inadequate adaptation to stress is often associated with the absence of flexible coping strategies that are appropriate to specific situations and contexts.

Choosing effective coping strategies is crucial, particularly in high-stress professions such as teaching. Wang et al. (2022) emphasized that appropriate coping strategies foster positive emotions, reduce burnout, and enhance teachers' mental health. Conversely, ineffective coping strategies may intensify negative emotions, increase stress

levels, and negatively affect individuals' psychological well-being. Similarly, Orlanda-Ventayen et al. (2021), as cited in Fernandez (2023), examined workplace stress and depression among educators. Their findings revealed that while teachers frequently experience work-related stress, some also suffer from depression. The study highlighted the importance of learning stress management techniques and implementing effective coping strategies to reduce both stress and depressive symptoms.

Emotional regulation has also been identified as a key factor in reducing burnout. Cruz (2020) reported that increased emotional stability is significantly associated with lower levels of burnout. Likewise, Pellerone et al. (2020) found that teachers who are able to regulate their emotions effectively tend to have better well-being and healthier professional relationships within academic settings. In general, coping strategies can be described as specific behaviors and responses individuals use to manage challenging or stressful circumstances (Barnová et al., 2023).

Coping strategies are commonly categorized into different types based on how individuals respond to stressors. Problem-focused coping involves directly addressing the source of stress in an effort to resolve the problem (Carroll et al., 2022). In contrast, emotion-focused coping centers on managing emotional reactions rather than changing the stressor itself. In addition, some individuals employ avoidance-based coping, which involves distancing oneself physically or psychologically from the stressor. Others use approach-based coping, which entails actively engaging with the stressor and attempting to manage it constructively (Maqsood et al., 2024). Supporting this classification,

Olasehinde (2025) identified three major coping strategies: problem-focused, emotion-focused, and avoidant coping.

Problem-focused Coping

Problem-focused coping involves deliberate efforts to recognize and directly address the source of stress. This approach emphasizes practical strategies to resolve the problem or modify the conditions that cause distress. These strategies are employed when a stressor is perceived as manageable or when additional information about the issue can be gathered to address it effectively. According to Olasehinde, (2025) this coping style is positively correlated with improved psychological well-being, particularly when the stressor is perceived as controllable.

Individuals employing problem-focused coping typically report reduced anxiety and depression levels, along with enhanced life satisfaction. This type of coping focuses on taking direct action to alter either the external environment or one's internal responses, aiming to resolve the source of stress rather than merely alleviating its emotional impact. Aulén et al., (2021) Educators employ strategies that concentrate on the problem to address specific situations they perceive as challenging. They seek guidance or assistance from colleagues who have faced similar difficulties (Barnová et al., 2023). Moreover, this coping strategy fosters emotional resilience, enabling individuals to recover from stressful experiences more efficiently and adaptively.

Emotion-focused Coping

Emotion-focused coping, as described by Olasehinde, (2025) involves strategies designed to regulate or reduce the emotional impact of a stressor rather than addressing the stressor itself. Such strategies include seeking social support, using relaxation techniques, or engaging in activities that provide emotional comfort, such as prayer, journaling, or self-soothing behaviors. This form of coping proves particularly beneficial when the stressor is beyond one's control, in which case emotional regulation becomes a crucial means of psychological adaptation. According to Suttles, (2024) participants reported seeking support from their family and community, both within and outside the classroom. Every participant agreed that talking to and spending time with family members helps them relieve stress.

Baker et al., (2021) also discovered that enhancing protective factors (such as prioritizing personal health, engaging with family and friends, and building connections with supportive individuals) was associated with improved coping and resilience among teachers. Graves et al., (2021) supported the claim that women experience greater stress levels and are more likely to utilize emotion-focused coping. They tend to employ strategies such as self-distraction, seeking emotional support, and expressing their feelings more frequently than men do in educational contexts. These trends, as reflected in the research conducted by Maqsood et al., (2024) provide a more nuanced understanding of gender-specific coping strategies during stressful situations.

Avoidant Coping

Olasehinde, (2025) further explained avoidant coping as behaviors and cognitive strategies aimed at disengaging from the stressor, often through avoidance, substance use, or distraction. This coping style includes both behavioral avoidances, such as withdrawing from social interactions, and cognitive avoidance, such as minimizing the significance of the stressor or using denial to cope with distress. According to William Joseph, (2025), emotional suppression is the attempt to suppress or disregard feelings, which over time may result in emotional dysregulation or numbness.

Research shows that individuals experiencing high levels of stress may rely more on strategies that divert attention from stressors rather than actively addressing them (Encarnacion, 2024). In educational contexts, this implies that teachers may use avoidant coping strategies that do not effectively reduce stress. Consequently, individuals employing this coping style often experience long-term stress and mental health challenges. For example, Marais-Opperman et al. (2021) describe escaping as a last-resort coping mechanism, such as when an educator resigns from teaching, highlighting the potential consequences of avoidance.

In addition, avoidant coping can exacerbate negative emotions by preventing individuals from confronting stressors and processing their feelings. Over time, unresolved emotional problems accumulate, increasing psychological distress. However, Aulén et al. (2021) indicate that teachers who use multiple coping strategies within a particular category often develop a clearer self-concept, enabling them to select strategies that are most effective for specific stressful situations. Joseph (2025) further highlights that

individuals with high emotional intelligence are more likely to adopt flexible coping strategies, emphasizing the importance of tailoring coping mechanisms to specific stressors.

Therefore, it is crucial to develop effective coping strategies that enhance problem-solving, emotional regulation, and resilience. Chronic exposure to stress can impair well-being and productivity, yet it may also foster adaptability. Accordingly, coping strategies play a central role in shaping how teachers respond to internal and external stressors, directly affecting their psychological fortitude and professional performance (Pagulong & Bulilawa, 2021). Mugat (2025) adds that teachers gradually cultivate coping mechanisms as part of their adjustment process, which evolves with experience and familiarity with the demands of the profession.

Moreover, research indicates that novice teachers and those with less than five years of experience exhibit the highest stress levels, whereas the most experienced teachers face greater risks of burnout (Barnová et al., 2023). Nevertheless, protective factors such as resilience can mitigate adverse outcomes. As teachers encounter new challenges throughout their careers, their coping strategies expand, enhancing their ability to withstand stress and manage difficulties effectively. The effectiveness of these strategies depends on factors such as personality traits, the nature of stressors, and available resources (Joseph, 2025).

Finally, Olasehinde (2025) proposed to maintaining teacher well-being requires supportive environments and organized intervention programs. Scheduled meetings, feedback sessions, and proactive problem-solving can help address difficulties before they

escalate (Qin, 2024). Likewise, Ghasemi et al. (2023) proposed further research to explore teachers' coping strategies in response to adverse events and to identify factors that influence specific methods, ultimately guiding the development of targeted programs that foster effective coping strategies.

Demographic Factors

There are many forms of work stress experienced by teachers, including internal, external, and even demographic factors. These factors not only reflect the distinctive characteristics of teachers but also clearly demonstrate how organizational and social contexts shape experiences of stress. Specifically, gender, years of service, age, and work status are examples of demographic factors (Muhamad et al., 2023).

Gender

According to Muhamad et al. (2023), the level of stress experienced by teachers often differs between males and females. Previous studies suggest that demographic variables, such as gender, can significantly influence occupational stress levels. Similarly, Loziak (2021) stated that gender affects the coping strategies teachers adopt when faced with stress, indicating that men and women tend to use different methods to manage challenging situations.

For instance, Raj (2024) found that over 60% of female teachers reported moderate to high levels of stress, compared to 50% of male teachers. This suggests that female teachers generally experience higher stress levels than their male counterparts. One contributing factor is the additional social and familial responsibilities often shouldered by

women. Many female educators manage heavy household and childcare obligations alongside their professional duties, which can elevate stress levels compared to men, who typically face fewer home-related responsibilities (Agyapong et al., 2022). In contrast, studies have reported that male teachers may exhibit lower self-efficacy than female teachers, which can also influence stress experiences and coping capacity (Perera et al., 2019). These findings highlight the importance of considering gender-specific characteristics when designing support systems and wellness interventions for teachers.

Moreover, research indicates that female educators have higher rates of depression than male educators (Capone et al., 2019; Othman et al., 2019). Therefore, addressing factors that influence teacher well-being is essential for reducing stress, preventing burnout, and minimizing attrition in the profession. Recognizing the interplay between the educational environment and teachers' demographics is critical for developing targeted interventions that enhance well-being across different groups (Nwoko et al., 2025). Likewise, interventions that specifically address gender disparities may be particularly beneficial for promoting the mental health and work efficiency of female teachers (Agyapong et al., 2022).

Age

Teachers' individual characteristics, including age, gender, experience, and educational background, can significantly influence their well-being at work, as noted by Nwoko et al. (2025). Similarly, age has been identified as a key factor affecting stress levels among educators. For instance, Noor Ismail et al. (2019) reported that teachers aged 30–

39 experience higher stress levels compared to those in the 40–49 age group. Vercambre et al. (2022) also highlighted that age-related differences exist in the intensity and sources of occupational stress.

In addition, Raj (2024) found that younger teachers, particularly those with fewer than five years of classroom experience, report significantly higher stress levels than their more experienced colleagues. Specifically, only 45% of teachers over 40 reported significant stress, whereas nearly 65% of teachers under 30 reported elevated stress levels. This suggests that early-career teachers may struggle with adjusting to classroom demands, managing workload, and achieving work-life balance.

In contrast, experienced teachers face unique challenges that may affect their well-being. According to Nwoko et al. (2025), older teachers may find it difficult to maintain enthusiasm and adapt to modern teaching methods. Alghamdi and Sideridis (2025) further observed that while younger teachers tend to experience lower burnout, older and more experienced teachers often exhibit higher levels of burnout. This trend may be attributed to rapid technological advances and educational practices that move beyond traditional teacher-centered models, requiring seasoned educators to continually adjust their teaching strategies.

Length of Service

A teacher's experience of stress and the coping mechanisms they employ can be greatly influenced by their length of time in the profession. This factor is closely linked to age, as early-career teachers often face different challenges than their more experienced

colleagues. Research indicates that novice teachers, typically those with less than five years of experience, are more likely to experience anxiety and stress due to the demands of adjusting to classroom responsibilities and managing workload (Pagán-Garbín et al., 2024; Ptáček et al., 2019).

In contrast, Alghamdi and Sideridis (2025) found that more experienced teachers tend to exhibit higher levels of burnout, whereas teachers with fewer than five years in the field generally show lower burnout levels. This suggests that while novice teachers may struggle with initial stress, seasoned educators may face cumulative pressures from prolonged exposure to professional demands. Understanding these differences is essential for designing targeted interventions that support teachers at various stages of their careers.

Civil Status

Commey-Mintah et al. (2023) noted that long workdays, tight deadlines, and limited family time due to work obligations can negatively affect a marriage, particularly the happiness of one partner. Consequently, Encarnacion (2024) emphasized that job responsibilities may influence marital satisfaction in this way. Understanding educators' experiences with stress, coping mechanisms, and job performance therefore requires taking their civil status into account. He further explains, for example, that married educators may have different pressures and support requirements than their single colleagues, especially when balancing work and home responsibilities. Likewise, teachers

who have lost a spouse might need specific types of support to manage the emotional effects of grief while continuing to perform their professional roles.

Moreover, Fan & Fang, (2025) demonstrated that marital status and gender significantly affect teachers' stress in rural areas. This could be explained by the fact that female educators frequently face conflicting demands from family and work obligations, which are compounded in rural areas by limited resources and social assistance.

Intervention Program

Several studies highlight the role of intervention programs in managing occupational stress among teachers. Teaching is recognized as a highly stressful profession, and stress can negatively impact teachers' mental health and job satisfaction if not effectively managed (Emeljanovas et al., 2023). Chronic stress exposure has been associated with depression, anxiety, burnout, and a decline in teacher productivity, indicating the importance of interventions (Agyapong et al., 2022; Skaalvik et al., 2018). In addition, since they have few coping strategies, new instructors become particularly vulnerable, therefore Pagán-Garbín et al. (2024) proposed that early intervention is important. Researchers emphasize that in order to support teacher well-being and maintain teaching effectiveness, resilience-building and coping-focused intervention programs are crucial (Barnová et al., 2023; Olasehinde, 2025).

Theoretical Framework

This study on teachers' stressors and coping mechanisms serves as the foundation of Richard Lazarus' Transactional Theory of Stress and Coping (1997) and Ingrid Cordon's Biopsychosocial Model of Stress (1997).

Transactional Theory of Stress and Coping by Lazarus (1997). Stress is considered a relational concept; it is not characterized by a specific external stimulus or event, nor by rigid physiological, behavioral, or emotional responses. Instead, it emphasizes the connection between the person and the environment (Lim et al., 2023). Coping can be described as a continuous process that includes behavioral and cognitive strategies for dealing with both internal and external challenges perceived as too much or beyond a person's capabilities. From this perspective, coping refers to the behavioral and mental strategies used to manage stress. This idea emphasizes that coping strategies are distinct from their outcomes, allowing their impact on adaptation to be assessed independently from a research perspective (Lazarus, 1996). From a research viewpoint, this concept highlights that coping efforts are considered separate from outcomes, allowing their effects on adaptation to be evaluated independently (Lazarus, 1996).

According to Richard Lazarus and Folkman's Transactional Model, as cited by Borbowski (2005), stress can be thought of as resulting from an imbalance between demands and resources or as occurring when pressure exceeds one's perceived ability to cope. Stress management was developed and premised on the idea that stress is not a direct response to a stressor but instead on one's resources and ability to manage and mediate the stress response, and that this is amenable to change. Therefore, to create an

effective stress management program, it is essential first to determine the key factors that enable individuals to regulate stress, and then design interventions that specifically address those factors. The model proposes that people can be taught to manage their stress and cope with their stressors. They may learn to change their perspective on the stressor, thereby gaining the ability and confidence to improve their lives and handle all types of stressors.

The Biopsychosocial Model of Stress by Cordon (1997) states that stress comprises three interrelated components: external factors, internal factors, and the connection between the two. The external component refers to the events or conditions in the environment that occur before a person becomes aware of feeling stressed and that can trigger a stress response. These stressors generally fall into four main areas: personal, social or family-related, work-related, and environmental. Such experience is known to contribute to both psychological strain and physical health problems. Landow (2006) also points out that the loss of a loved one, or bereavement, is one of the most challenging stressors and has offered early evidence showing a connection between stress and immune system functioning.

This study's primary theoretical foundation is Lazarus's (1997) Transactional Theory of Stress and Coping, which emphasizes the dynamic interaction between people and their surroundings in reaction to stress. Teachers may not always be able to meet all of the demands placed on them by their institutions, classrooms, and personal lives. Accordingly, the theory offers a framework for comprehending how teachers respond to stressful circumstances and the coping strategies they use. Teachers' reactions and general

well-being are directly affected by their capacity to assess stress, whether it is perceived as a challenge or a threat. Therefore, this study examines how teachers perceive and react to stress in both their personal and professional environments using Transactional Theory.

On the other hand, the Biopsychosocial Model of Stress by Ingrid Cordon (1997) further strengthens the study by suggesting that stress among teachers does not arise from a single source but instead results from the interaction of biological, psychological, and social factors. Teaching is a profession that demands mental, emotional, and physical endurance. The theory of Ingrid Cordon helps us understand why teachers experience stress differently and highlights the need to address it holistically, considering their physical health, emotional state, and social support.

1.4 Schematic Diagram

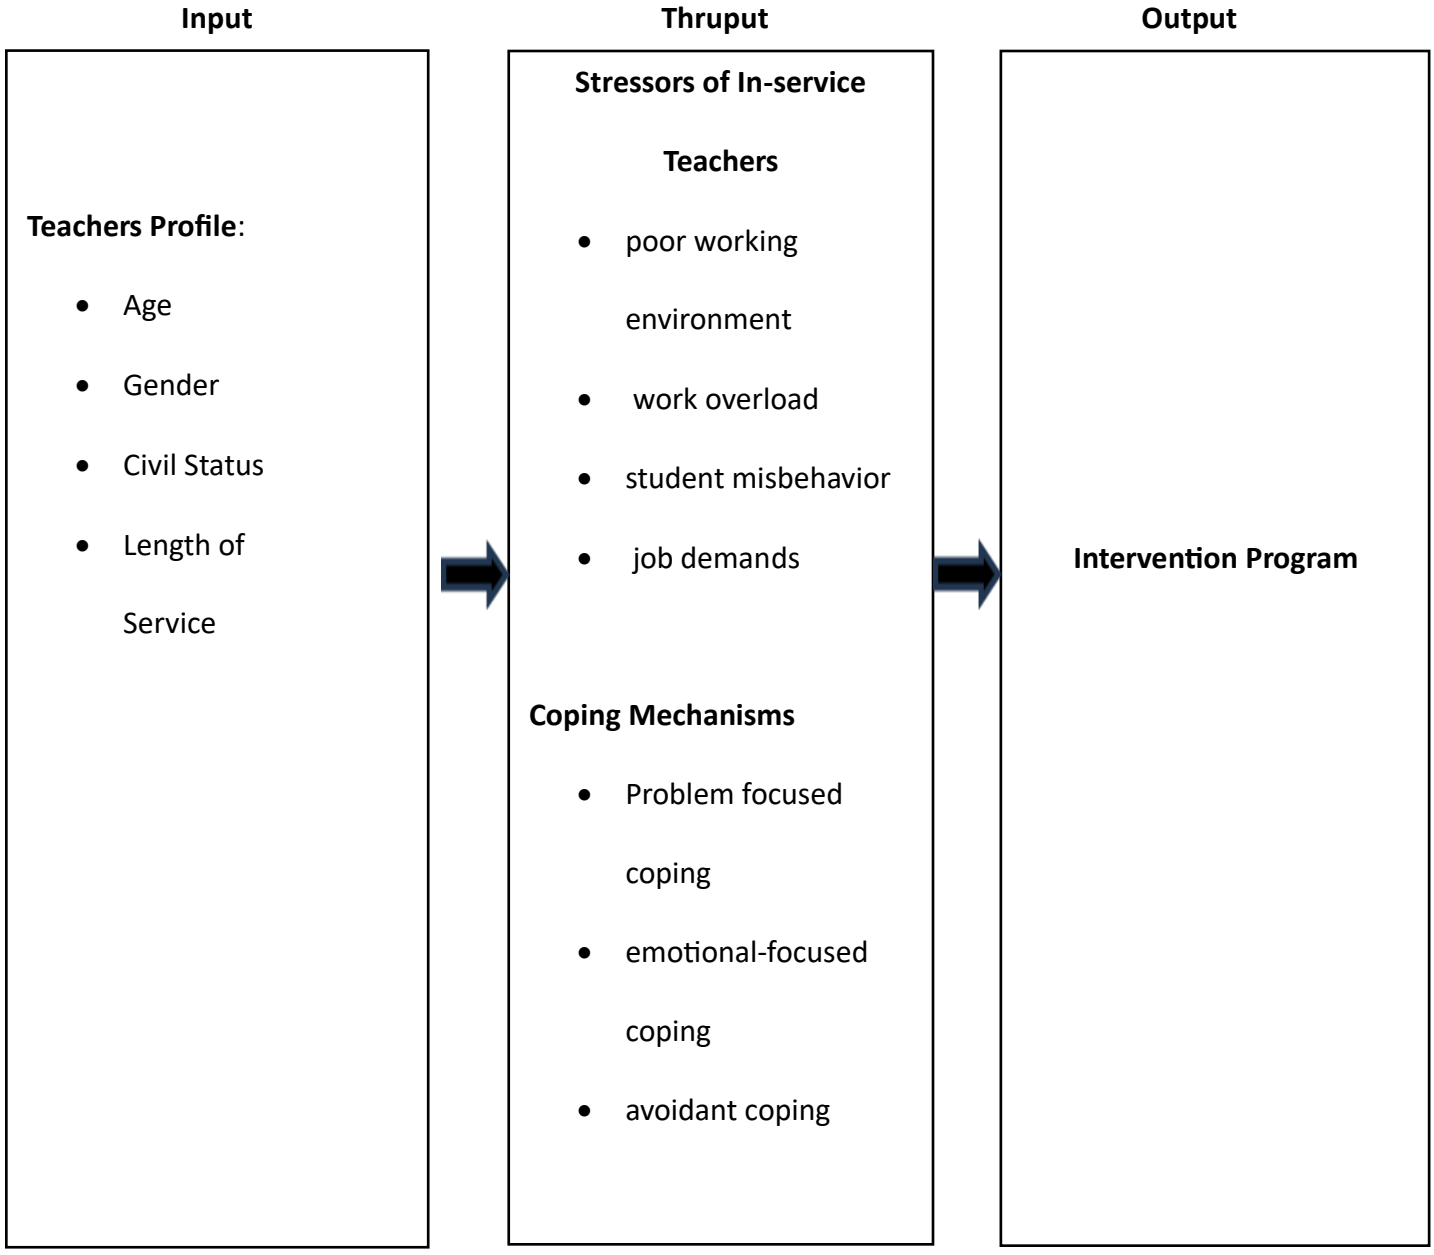

Figure 1. The figure shows the interplay of the variables of the study.

1.5 Statement of the Problem

The purpose of the study is to determine the stressors experienced by the Central Elementary Teachers at Nasipit, Agusan del Norte, and their coping strategies, which serve as the basis for the development of an intervention program to address the identified stressors.

Specifically, this study seeks to answer the following questions.

1. What is the profile of the participant in terms of:

    1.1 age;

    1.2 gender;

    1.3 civil status; and

    1.4 length of service?

2. What is the level of stress experienced by the Public Central School Teachers of Nasipit, Agusan del Norte in terms of:

    2.1. poor working environment;

    2.2. work overload;

    2.3. student misbehavior; and

    2.4. job demands?

3. What is the level of coping mechanism of the public central school teachers of Nasipit, Agusan del Norte in terms of:

    3.1. problem-focused coping;

    3.2. emotion-focused coping; and

    3.3. avoidant coping?

4. Is there significant relationship in the stress levels experienced by the Public Central School Teachers at Nasipit, Agusan del Norte with their profile?
5. Is there significant relationship in the stress levels experienced by the Public Central School Teachers at Nasipit, Agusan del Norte and their coping mechanism?
6. What coping mechanisms do the respondents prefer to use in response to the stress they experienced?
7. Based on the findings of the study, what intervention program may be develop?

1.6 Hypothesis of the Study

The following hypothesis guided by the study and tested at a 0.05 level of significance.

HO1: There is no significant relationship in the stress levels experienced by the Public Central School Teachers at Nasipit, Agusan del Norte with their profile.

HO2: There is no significant relationship in the stress levels experienced by the Public Central School Teachers at Nasipit, Agusan del Norte and their coping mechanism.

HO3: None of the coping mechanisms do the respondents prefer to use in response to the stress they experienced.

Scope and Limitation of the Study

This study will be conducted in three central schools in Nasipit, Agusan del Norte, namely; Nasipit Central Elementary School (NACES) with forty-eight (48) teachers, Talisay Central Elementary School SPED center (TCESSC), thirty-seven (37) teachers, and Mateo B. Abao Central Elementary School (MACES), twenty-one (21) teachers. Collectively, these schools have a total of one hundred six (106) teachers.

The study is limited to central schools in Nasipit, Agusan del Norte. These schools is chosen because they are the main public elementary schools in the municipality and have greater numbers of pupils and teachers. Furthermore, central schools have more established administrative systems and resources than smaller ones, making them ideal for collecting representative data and accurate information in line with the objectives of the study.

This study also examines the primary sources of stress experienced by the central school teachers in Nasipit, Agusan del Norte, including a poor working environment, work overload, student misbehavior, and job demands. It also examines the coping mechanisms respondents employ, including problem-focused and avoidance coping.

1.7 Definition of Terms

Age. This indicates the number of years a respondent will have lived. Respondents will be grouped into age ranges: 20–29, 30–39, 40–49, and 50 and above.

Avoidance Coping. This implies to how respondents will avoid or escape stressful situations instead of facing them. This will include procrastination, avoiding responsibilities, and engaging in non-work activities.

Civil Status. This pertains to the marital status of the respondents, whether single, married, widowed, or separated.

Coping Mechanism. This pertains to the strategies respondents will use to manage stress. These will include problem-focused coping, emotion-focused coping, and avoidance coping, as measured by the Brief COPE Inventory.

Emotion-Focused Coping. This refers to how respondents will manage their emotional reactions to stress. This will include relaxation, prayer, positive self-talk, and seeking support from others.

Intervention Program. This refers to the set of activities that will be developed based on the study findings to reduce teachers' stress and improve their coping skills.

Job Demands. This refers to the amount and difficulty of work tasks respondents will handle, including teaching and administrative duties, as measured through a questionnaire.

Length of Service. This indicates to the number of years respondents will have been in the teaching profession. This will be grouped into 1–5, 6–10, 11–15, and 16 years and above.

Poor Working Environment. This is defined as physical or organizational conditions at work that will contribute to teachers' stress, such as inadequate facilities and limited support.

Problem-Focused Coping. This refers to actions respondents will take to deal directly with the sources of stress. This will include planning, problem-solving, and seeking help.

Sex. This refers to whether respondents will be male or female.

Student Misbehavior. This refers to student actions that will disrupt teaching and classroom management, such as disobedience, inattention, and absenteeism.

Stressors. This pertains to factors that will cause respondents to feel stress, including job demands, work environment, relationships, and technology-related tasks.

Work Overload. This refers to having more work tasks than can be completed within regular working hours, including heavy workloads and tight deadlines.

CHAPTER 2

RESEARCH METHODOLOGY

This chapter includes the research design used in the conduct of this study, followed by the research materials and methods, research environment, population and sample, data analysis plan, and ethical standards.

2.1 Research Design

This study will employ a descriptive-correlational research design. This study is descriptive because it will examine the level of stress teachers experience and the coping strategies they often use. It is correlational because it seeks to examine the relationships among stressors such as poor working environment, work overload, student misbehavior, job demands, human relations, and coping mechanisms, including problem-focused, emotion-focused, and avoidant coping.

Moreover, the study considers demographic variables age, gender, civil status, and length of service to determine how these factors may influence both the levels of stressors and the coping mechanisms used by the respondents.

2.2 Research Locale

This study will be conducted in the municipality of Nasipit, province of Agusan del Norte, specifically in three (3) Public Central Elementary Schools within the area, namely: **School A**. located at Barangay 4, Nasipit, Agusan del Norte (Lat. 8.9859° N, Long. 125.3427° E), with forty-eight (48) teachers. School A serves as the main public elementary school in

its barangay, accommodating a large population of learners and providing a representative setting for studying teachers' stressors.

School B. located in Purok Magkuno, Talisay, Nasipit, Agusan del Norte (Lat. 8.9817° N, Long. 125.3397° E), with thirty-seven (37) teachers. School B caters to both regular and special education students, allowing the study to explore stressors in a diverse teaching environment.

School C. located in D-2 Kinabjangan, Nasipit, Agusan del Norte (Lat. 8.9746° N, Long. 125.36006° E), with twenty-one (21) teachers. School C is a central school with moderate class sizes and well-structured programs, making it suitable for observing work-related stressors.

These schools are selected as the research locale because they serve as the primary public elementary centers in the municipality, accommodating many learners in their respective barangays. These public school institutions in the area are suitable settings for studying teachers' stressors and coping mechanisms. Moreover, teachers in these schools handle large class populations, which can lead to work-related stressors. Selecting these institutions ensures they will provide the study with meaningful insights to improve teacher well-being and school support in the community.

2.3 Research Environment, Population and Sample

The study's respondents will be determined using a purposive sampling technique, and there will be teachers selected from the three public central schools in Nasipit, Agusan del Norte. The study will employ purposive sampling, as the respondents will be

intentionally selected based on their relevance to the research aims. This is purposive because only teachers who have direct experience with the stressors and coping mechanisms being studied are chosen, ensuring that the information collected is meaningful and directly related to the research objectives. Teachers from the three public central schools in Nasipit, Agusan del Norte will be chosen by the researchers, as they have direct experience with the stressors and coping mechanisms that the study intends to examine. This approach will ensure that the respondents are informed and able to provide meaningful insights related to the study's focus.

This study has a total of one hundred six (106) respondents, with forty-eight (48) teachers from School A, thirty-seven (37) teachers from School B, and twenty-one (21) teachers from School C. These numbers represent the teachers who will participate in the study, ensuring that the results reflect their experiences.

Table 1. The Distribution of Respondents of the Study

	Male		Female		Total	
School	**F**	**%**	**F**	**%**	**F**	**%**
School A	7	46.67	41	37.61	48	43.40
School B	3	20.00	34	14.68	37	34.91
School C	5	33.33	16	31.19	21	19.81
Total	**15**	**13.33**	**91**	**83.49**	**106**	**100**

Research Instruments

The main research instrument used in this study is a researcher-made questionnaire designed to gather accurate and sufficient data about the stressors faced by public central elementary school teachers. The questionnaire is developed by using validated tools, established literature, and relevant theories on teacher stress to ensure it is valid, aligned with the topic, and reliable.

The questionnaire consists of four (4) major parts, with each part representing a specific category of teacher stressors identified in the review of literature: (1) Poor Working Environment, (2) Work Overload, (3) Student Misbehavior, and (4) Job Demands. Each part contains six (6) items, for a total of twenty-four (24). The respondents will answer each item using a 4-point Likert scale: 1 – Strongly Disagree, 2 – Disagree, 3 – Agree, and 4 – Strongly Agree.

Part I: Poor Working Environment (6 items). This section assesses teachers' perceptions of the school environment, particularly focusing on leadership relations, communication, trust, and physical working conditions. The items were developed by the researchers based on concepts presented in the validated questionnaire on teacher stress by Dr. Abigail M. Cabaguing (2021). Sample items describe issues such as lack of administrative support, poor communication, distrust in leadership, and the presence of uncomfortable or unpleasant working conditions.

Part II: Work Overload (6 items). This part measures the extent to which teachers experience excessive workload. Items include concerns related to lesson preparation, administrative paperwork, ancillary functions, large class sizes, and extended working

hours. Several statements are researcher-made and refer to the concepts discussed by Cabaguing (2021), while other workload-related items refer to the findings of Bongco and Ancho (2019) regarding factors contributing to the growing administrative and instructional burden on teachers.

Part III: Student Misbehavior (6 items). This section looks at how classroom discipline and student behavior affect teachers' stress. Two questions are researcher-made and refer to the issues discussed by Cabaguing (2021), such as students' lack of interest and challenges with discipline. Other items were also researcher-made and refer to concepts from well-known and validated tools, including the Student Misbehavior Scale (Sun & Shek, 2012), the Teacher Stress Inventory (Fimian, 1984), and the Teacher Stress Framework of Skaalvik and Skaalvik (2017).

Part IV: Job Demands (6 items). The last section examines job pressures that require ongoing effort and quick task completion. The questionnaire are researcher-made and refer to well-known models of occupational stress, including the Job Demand Scale (Karasek, 1979), the Job Demands–Resources (JD-R) Model (Bakker & Demerouti, 2007), the Teacher Work Pressure Items of Skaalvik and Skaalvik (2017), and the Emotional Exhaustion Subscale of (Maslach & Jackson, 1981).

The researchers will adapt the Brief COPE, a 24-item questionnaire by Carver (1997), to assess how teachers cope with stress. The Brief COPE is designed to measure both helpful and unhelpful ways people respond to stress. It is widely used in health, psychology, and education to study how people handle stress from illness, work, trauma,

and daily life. For the purpose of this study, the instrument is organized into three (3) main parts, each representing a broader dimension of coping strategies.

Although the original Brief COPE contains 14 two-item subscales, the researchers will adapt 12 subscales to the study's needs, resulting in 24 items. These subscales are grouped into the following overarching categories: problem-focused coping, emotion-focused coping, and avoidant coping. Each subscale contains two (2) items, contributing to the total of 24 items in the adapted instrument.

Part I. Problem-Focused Coping. This section is focused on strategies for managing or solving the causes of stress. This category includes subscales such as Active Coping, Planning, and Use of Instrumental Support, which offer practical ways to deal with stress.

Part II. Emotion-Focused Coping. This section is focused on ways to manage emotional reactions to stress. It includes subscales such as Positive Reframing, Acceptance, Humor, Religion, and Use of Emotional Support, which help people manage their feelings during stressful times.

Part III. Avoidant Coping. This section is focused on strategies that help people distance themselves from stress. This group includes Self-Distraction, Venting, Denial, and Behavioral Disengagement. The last part of this section examines unhelpful habits, especially those that indicate emotional withdrawal or unproductive responses to stress. Studying these avoidant strategies is important because they can lead to more emotional distress or burnout for teachers.

All items included in the instrument are researcher-made for the stressor questionnaire and refer to the works of the authors mentioned above, while the coping

mechanisms questionnaire is adapted from Carver's (1997) Brief COPE, a validated and widely utilized coping inventory in behavioral and health research.

2.4 Data Gathering Procedure

Before the actual data collection, the researchers will ensure that all ethical and administrative requirements are fulfilled. The researchers will first obtain permission from the Dean, VPAAR, and Program Head of Saint Michael College of Caraga to formally conduct the study. After securing approval, the researchers will proceed with the data-gathering process and will follow the established research protocols to maintain the validity and reliability of the study. The researchers will also request permission from the principals of the selected Central Schools in Nasipit, Agusan del Norte, namely: School A, School B, and School C. The researchers will submit formal letters clearly stating the purpose of their study entitled "Stressors and Coping Mechanisms of In-Service Teachers: Basis for Intervention Program." Once the respondents complete the questionnaires, the researchers will retrieve them immediately. The gathered data will then be organized, collated, and tabulated according to the research problems identified in the study.

Letter of Approval. The researchers will secure signed approval letters from the Dean, VPAAR, and Program Head of Saint Michael College of Caraga, as well as from the school principals of the identified schools. These approval letters will allow them to distribute the research item to the teachers. The letters will serve as authorization to conduct the study and gather the necessary data from the respondents.

Informed Consent. Before conducting the study, the researchers will inform the respondents about the nature and purpose of the study by clearly explaining its goals, the specific issues being examined, and why their participation is important. The researchers will also describe the procedures to be undertaken, how the data will be collected, and the approximate time needed to accomplish the questionnaire. The respondents will be informed about any possible minimal risks, such as discomfort when answering certain questions, as well as the potential benefits, including contributing to a better understanding of the topic and helping improve practices in the school setting.

Furthermore, the researchers will emphasize that participation is completely voluntary, and respondents may refuse or withdraw from the study at any time without any consequences. The researchers will also explain how confidentiality and privacy will be protected by ensuring that all information provided will be used only for research purposes and will not be linked to their identities. After being fully informed of all these details, they will be asked to sign an informed consent form before answering the questionnaire.

Distribution of the Questionnaire. The researchers will personally visit each selected school and distribute printed copies of the survey questionnaire to the teachers. The researchers will coordinate with the principal or assigned school contact person to schedule the distribution and retrieval dates. Respondents will be given enough time to answer the questionnaire during their free period or at a convenient time agreed upon by the school administration.

Gathering of Data. After the collection period, the researchers will check, tally, and organize the completed questionnaires. The gathered data will then be presented, analyzed, and interpreted using appropriate statistical tools to answer the research questions and serve as the basis for the proposed intervention program.

Data Analysis Plan and Procedure

The collected data will be organized, analyzed, and interpreted using appropriate statistical methods suited for a quantitative descriptive–correlational design.

Frequency and Percentage. To describe the profile of the respondents in terms of age, gender, civil status, and length of service.

Mean. To determine the level of stress experienced by the Central Schools Teachers and the coping mechanisms they use.

Correlational Analysis. To find out if there is a significant relationship between the stress levels and coping mechanisms of the respondents

Regression Analysis. To determine how coping mechanisms predict or influence teachers' stress levels.

The results will be interpreted using the Likert scale and analyzed both descriptively and inferentially to answer the research questions and guide the development of the proposed intervention program.

2.5 Research Ethical Standards

Ethical Consideration

A. Intellectual Property Rights (IPR)

The study will respect intellectual property rights by ensuring that all research outputs, including instruments and analytical frameworks used, will be protected under Philippine copyright law. All third-party sources and secondary data in this research will be properly cited. Since no new logos, symbols, or brands will be created, there will be no need for trademark registration.

B. Informed Consent

Before conducting the study, the researchers will inform the respondents about the nature and purpose of the study by clearly explaining its goals, the specific issues being examined, and why their participation is important. The researchers will also describe the procedures to be undertaken, how the data will be collected, and the approximate time needed to accomplish the questionnaire. The respondents will be informed about any possible minimal risks, such as discomfort when answering certain questions, as well as the potential benefits, including contributing to a better understanding of the topic and helping improve practices in the school setting.

Furthermore, the researchers will emphasize that participation is completely voluntary, and respondents may refuse or withdraw from the study at any time without any consequences. The researchers will also explain how confidentiality and privacy will be protected by ensuring that all information provided will be used only for research

purposes and will not be linked to their identities. After being fully informed of all these details, they will be asked to sign an informed consent form before answering the questionnaire.

C. Data Privacy and Confidentiality

The researchers will keep all information from surveys completely confidential. The researchers will collect personal details, such as names and demographic information, only if participants give their consent. To protect privacy, all responses will be anonymized, and no identifying details will appear in the research report. Anonymized data will be used or shared for academic purposes only, with respondents consent and in compliance with ethical and legal standards. The researchers will commit to reporting results truthfully, without bias, and will use all data solely for academic purposes.

D. Voluntary Participation

Informed consent stating that participation is voluntary will be discussed. If any discomfort arises, participants will be allowed to withdraw from the study without consequences.

E. Minimization of Harm

Respondents in this study may experience minimal risks, such as feeling uncomfortable, stressed, or self-conscious while answering the survey questions. If any respondents feels distressed or uneasy during data collection, the researchers will immediately stop the survey and provide appropriate support to address their concerns, such as offering time to rest, listening to their concerns, and guiding them toward available

school-based support services like the guidance office or counselor if necessary. The researchers will also remind respondents that they may withdraw from the study at any time without any negative consequences. All measures will be taken to minimize emotional or psychological discomfort, and participants will be encouraged to seek further support from trusted teachers, the guidance office, or relevant school personnel if needed.

F. Beneficence

This research will aim to help understand the challenges teachers face at Central Schools in Nasipit, Agusan del Norte, and how these challenges affect their work and well-being. By finding out what causes the most stress and which coping methods work best, the study will guide future support programs and wellness efforts for teachers. These steps will help make the school a healthier, more positive place where teachers will feel appreciated and better prepared to meet daily challenges. The study will also aim to raise awareness among school leaders, students, parents, and the community about what teachers go through, encouraging empathy and stronger cooperation between the school and the community.

Respondents may not notice benefits right away, but their involvement will help the researchers learn important lessons that can improve teacher support programs and education policies. If respondents request, they will receive a summary of the research findings to reflect on the results and use the information for their own growth or to support their school community.

G. Justice and Fair Participant Selection

The study will ensure that respondent selection is inclusive and unbiased by allowing diverse groups equal opportunities to participate. Respondents will be selected by using purposive sampling method, ensuring that every teacher has an equal chance of being part of the study. The researchers will avoid any exclusion criteria unless they are relevant to the objectives of the study. Throughout the process, all respondents will receive equal quality of treatment before, during, and after the study.

A total of one hundred six (106) respondents will be selected for this study. This number will be determined based on the total population of teacher respondents from the three participating schools. Specifically, **forty-eight (48)** teacher respondents will be from **School A, thirty-seven (37)** teacher respondents will be from **School B, and twenty-one (21)** teacher respondents will be from **School C.**. The selection will ensure fairness and representation across schools while keeping the sample size manageable for accurate data collection and analysis.

H. Data Integrity and Accuracy

To uphold data accuracy and validity, multiple integrity measures will be employed. The researchers will double-check responses to prevent input errors and any inconsistencies in the raw data. The modified test questionnaire will be reviewed by research advisers to ensure it will appropriately measure the study's variables.

I. Transparency in Reporting

In reporting the findings, all data will be anonymized to guarantee that individual responses cannot be linked back to respondents, further safeguarding their confidentiality.

The researchers will commit to presenting the data truthfully and accurately while maintaining the confidentiality of all respondents. The results will be used solely for the intended research purposes. Moreover, the researchers will acknowledge the copyrighted materials through proper citation in the research paper. The researchers also declare that there are no existing or potential conflicts of interest (COIs) that may influence the conduct or outcomes of the study. In addition, the researchers acknowledge the use of AI-assisted tools during certain stages of the research process; however, a detailed explanation of its responsible use will be provided in the section dedicated to Responsible Use of AI.

J. Use of Patented or Copyrighted Materials

The researchers will use a non-standardized, researcher-made stressor questionnaire, which refers to the works of the authors mentioned in the instrument section. This includes freely accessible stress-related scales available in the college library, which the instructor advised them to use as a guide. Meanwhile, the researchers will adapt the standardized Brief COPE, as instructed by the author, which is freely available. Proper citation will be provided to uphold the intellectual property rights of the authors.

K. Ethical Considerations for Animal and Human Trials

The researchers will use an informed consent form detailing the risks and benefits respondents may obtain from participating in the study. The researchers will also give respondents time to ask clarifying questions to ensure complete agreement before finally taking part in the study. The informed consent will also state that possible support services will be provided if needed and that participants have the right to withdraw from the study

at any time. Further explanations regarding these support services and the right to withdraw will be discussed in the Minimization of Harm and Risk Management section.

L. Responsible Use of AI and Related Technologies

The study will use AI tools and digital technologies to support different parts of the research process. Grammarly will help maintain proper grammar and clarity in the report. ChatGPT will be used to find ideas that expand the literature review. To use these technologies responsibly, the researchers will review all AI-generated content and ensure it does not introduce bias or errors. The researchers will also inform respondents about the use of these tools to keep the research process transparent and trustworthy.

M. Ethical Approval

Ethical approval for the research will be granted by the Research Ethics Committee (REC) of Saint Michael College of Caraga (SMCC), verifying compliance with all applicable guidelines regarding respondents protection, data privacy, and intellectual property rights.

ALEXIS L. SENANIN
School Principal III
Nasipit Central Elementary School
Brgy.4 Nasipit Agusan del Norte

Dear Ms. Senanin,

Greetings of Peace!

In partial fulfillment of the requirements for the degree, Bachelor of Elementary Education (BEED) at Saint Michael College of Caraga, we the third-year students, are currently preparing a thesis proposal entitled: **"Stressors and Coping Mechanism of Teachers: Basis for Intervention Program"**

In connection with this, we respectfully seek your permission to conduct our study at your esteemed institution. As part of the initial stage of our research, we also request a copy of the list of teachers for the school year 2025–2026. This information will serve as a vital reference in identifying repondents for our study.

We assure you that the list and any subsequent data gathered will be treated with strict confidentiality and will be used solely for academic purposes. No personal or sensitive information will be disclosed.

Your approval and support in this academic endeavor will greatly aid us in completing our research study.

We look forward to your favorable response to this request. Thank you very much for your consideration and assistance.

Respectfully yours,

ROSE ANN Q. OGANG
Research Leader

PERMISSION TO USE RESEARCH INSTRUMENT IN OUR RESEARCH STUDY

1 message

Rose Ann Ogang <annquin0322@gmail.com> Fri, Oct 17, 2025 at 8:26 AM
To: ccarver@miami.edu

Dear Dr. Carver,

Greetings!

We are 3rd Year Bachelor of Elementary Education (BEED) students from Saint Michael College of Caraga, currently conducting a research study entitled "STRESSORS AND COPING MECHANISM OF TEACHERS: BASIS FOR INTERVENTION PROGRAM" as part of the requirements for our degree.

In line with this, we have come across your study on the Brief COPE. We found your research instrument highly relevant and appropriate for our study. With respect for your scholarly work, we humbly request your permission to adapt and revise the Brief COPE for academic and research purposes only.

We assure you that the instrument will be used solely for non-commercial and academic purposes, and proper acknowledgment and citation of your work will be strictly observed in our manuscript and any related presentations.

We would be deeply grateful for your approval and support. Thank you very much for considering our request. May you continue to be blessed in your academic and professional endeavors.

Respectfully yours,

ROSE ANN Q. OGANG
Research Leader

INTRODUCTION

You are being invited to participate in a research study conducted by researcher/researchers above who are affiliated with Saint Michael College of Caraga.

You have been selected as a potential informant because you meet the criteria necessary for inclusion in our study.

Your participation in this study is entirely voluntary. We encourage you to take your time to review the information provided below. Please feel free to ask any questions or seek clarification on any part of the study that you do not fully understand before deciding whether to participate. Additionally, you may choose to discuss your potential involvement in this research with family members or friends.

Should you decide to participate, you will be asked to sign this consent form. A copy of this

form will be provided for your records.	
In case of concerns about the study, you may contact the Research And Instructional Innovation Deparment through the following: • Email: riid@smccnasipit.edu.ph • Contact number: 09778064574 Or the researchers of this study: • EMAIL: roseann_ogang@smccnasipit.edu.ph • CONTACT NUMBER: 09051268601	
PURPOSE OF THE STUDY	The purpose of this study aims to ; 1. Examine the relationship between the teachers' stress levels and their demographic profile such as age, gender, civil status, and length of service. 2. Determine the level of stress experienced by public central school teachers in Nasipit, Agusan del Norte in relation to their working environment, workload, student behavior, and job demands. 3. Identify the coping mechanisms used by teachers in managing stress, including problem-focused, emotion-focused, and avoidant coping mechanisms. 4. Develop an intervention program based on the findings to help teachers effectively manage stress and promote their well-being.
PROCEDURES OF THE STUDY	Please Check below which type of study is being conducted ☒ For Quantitative and Survey Questionnaires: *If you volunteer to participate in this study, you will be asked to participate by answering the survey questionnaire which you can finish in less than 30 minutes.* ☐ For Interviews/ FGD / Case Studies *If you volunteer to participate in this study, you will be asked to participate by answering the questions in the interview guide which may last 30-40 minutes depending on the length of the interview. Moreover, this will be recorded through audio or video.* ☐ For capstones and experimental studies *If you volunteer to participate in this study, you will be asked to participate by allowing the researchers to use specimens and other data needed related to the research.*
POTENTIAL RISKS AND DISCOMFORTS	
You may experience some discomfort during the interview/questionnaires due to the sensitive nature of the topics being discussed. If at any point you encounter questions that cause psychological or emotional distress, you have the right to decline to answer without any consequence. Additionally, you may choose to withdraw from the study at any time if you feel unable to continue discussing the requested information. The researchers prioritize your well-being and will ensure that your comfort and welfare remain their highest priority throughout	

SAINT MICHAEL COLLEGE OF CARAGA

the study.
Potential discomforts are:

1. Some respondents may feel emotional discomfort when answering questions about their stress or personal experiences.
2. Some may experience slight fatigue or inconvenience while answering the survey questionnaire during free their free time.
3. Respondents may worry about the confidentiality of their responses. However, all information wil be kept strictly confidential and used for research purposes only.

POTENTIAL BENEFITS TO PARTICIPANTS AND/OR TO SOCIETY

This study aims to generate valuable insights that may benefit both public and private sector administrators, as well as human resource managers and policy-makers. The findings and discussions derived from this research can provide evidence-based information that may inform decision-making processes and strategic planning. Additionally, the results of this study may be of particular interest to government agencies such as:

1. Emotional Discomfort: Respondents may experience mild emotional discomfort when recalling or sharing experiences related to stress and coping.
2. Privacy Concerns: Respondents might feel uneasy about providing personal or professional information that relates to their work environment.
3. Time Constraint: Answering the survey questionnaire may take up some of the teachers' time during their busy work schedule.
4. Misinterpretation of Questions: Some repondents might misunderstand certain items in the questionnaire, which could lead to inaccurate responses or confusion.

CONFIDENTIALITY

All information gathered in this study will be treated with the utmost confidentiality, in accordance with applicable laws and regulations. Any identifiable information collected will be kept strictly confidential, except in cases where disclosure is necessary to protect your rights or welfare. This confidentiality agreement ensures that the researchers can protect your participation information from being accessed by individuals who are not directly involved in the study. When the results of this research are published or presented at conferences, your identity will not be revealed, and no personally identifiable information will be used.

PARTICIPATION AND WITHDRAWAL

Your participation in this study is entirely voluntary. Choosing not to participate will not result in any penalty or loss of benefits to which you are otherwise entitled. By participating in this study, you are not waiving any legal claims, rights, or remedies. You may withdraw from the study at any time without any negative consequences.

RESEARCH PARTICIPANT'S CONSENT

I have read and understood the information provided above. I have had the opportunity to ask questions, and my questions have been answered to my satisfaction. I understand that I will receive a copy of this consent form. I am aware that I can withdraw my consent at any time and discontinue my participation in the study without any penalties or loss of benefits to which I am otherwise entitled.

SURVEY QUESTIONNAIRE

PART I – RESPONDENTS' PROFILE

Directions: Please put a check (✓) or write your answer in the space provided.

1. Sex
☐ Male ☐ Female

2. Age:
☐ 20–25 years old
☐ 26–30 years old
☐ 31–35 years old
☐ 36–40 years old
☐ 41–45 years old
☐ 46 years old and above

3. Civil Status:
☐ Single
☐ Married
☐ Widowed
☐ Separated
☐ Others: _____

4. Length of Service:
☐ 1–3 years
☐ 4–6 years
☐ 7–9 years
☐ 10–12 years
☐ 13 years and above

PART II. STRESSORS IDENTIFICATION (researchers made)

Instruction:

Listed below are various kinds of stressors that may arise in your work as teachers. Indicate the frequency of the following problems, concerns, and obstacles to your duties in school by placing a check mark (✓) inside the box corresponding to how often you experience them.

Scale:

1 – NEVER: not experienced at all in your daily work
2 – SELDOM: happens once a month
3 – SOMETIMES: happens once a week
4 – USUALLY: happens several times a week
5 – ALWAYS: happens daily

A. Poor Working Environment

Indicators	1	2	3	4	5
I feel frustrated because I feel I know better than my immediate head.					
I feel like my school head has personal resentment towards me.					
My relationship with my supervisor lacks trust and respect.					
I feel bad that school administrators/head do not inform teachers about important matters.					
I feel disappointed that I cannot seek help and advice from my immediate head.					
Learning environment is not conducive because of unpleasant odors or school conditions.					

B. Work Overload

Indicators	1	2	3	4	5
I have too many lesson preparations beyond teaching hours.					
I have excessive administrative paperwork.					
I don't have enough time to relax after school due to work.					
I am assigned many ancillary functions (non-teaching tasks).					
I work beyond official hours to finish responsibilities.					
The number of students/classes I handle increases my workload.					

C. Student Misbehavior

Indicators	1	2	3	4	5
I feel disappointed when pupils show no interest despite my effort.					
I find it difficult to discipline my students.					
Students show disrespectful behavior (e.g., answering back, ignoring instructions).					
I feel stressed when students disrupt lessons by making noise or distracting others.					
I struggle to manage students who frequently argue or fight.					
Some students talk without permission and interrupt the class.					

D. Job Demands

Indicators	1	2	3	4	5
My job requires me to work very fast to meet deadlines.					
I often feel that there is too much work to finish in a limited time.					
I am required to juggle multiple tasks at the same time.					
I experience mental fatigue due to the demanding nature of my job.					
There are times when unexpected tasks or sudden deadlines add pressure to my work.					
I find it difficult to finish personal tasks because of work responsibilities.					

PART III – Coping Mechanism (Brief COPE Adapted Instrument)

Directions: Please read each statement carefully and put a check (✓) in the box that best represents how often you have been using each coping strategy.

Scale:

1 – I haven't been doing this at all
2 – I've been doing this a little bit
3 – I've been doing this moderately
4 – I've been doing this a lot

PROBLEM-FOCUSED COPING

Statement	1	2	3	4
I've been concentrating my efforts on doing something about the situation I'm in.				
I've been taking action to try to make the situation better.				
I've been getting help and advice from others.				
I've been trying to come up with a strategy about what to do.				
I've been looking for something good in what is happening.				
I've been trying to see it in a different light, to make it seem more positive.				
I've been trying to get advice or help from other people about what to do.				
I've been thinking hard about what steps to take.				

EMOTION-FOCUSED COPING

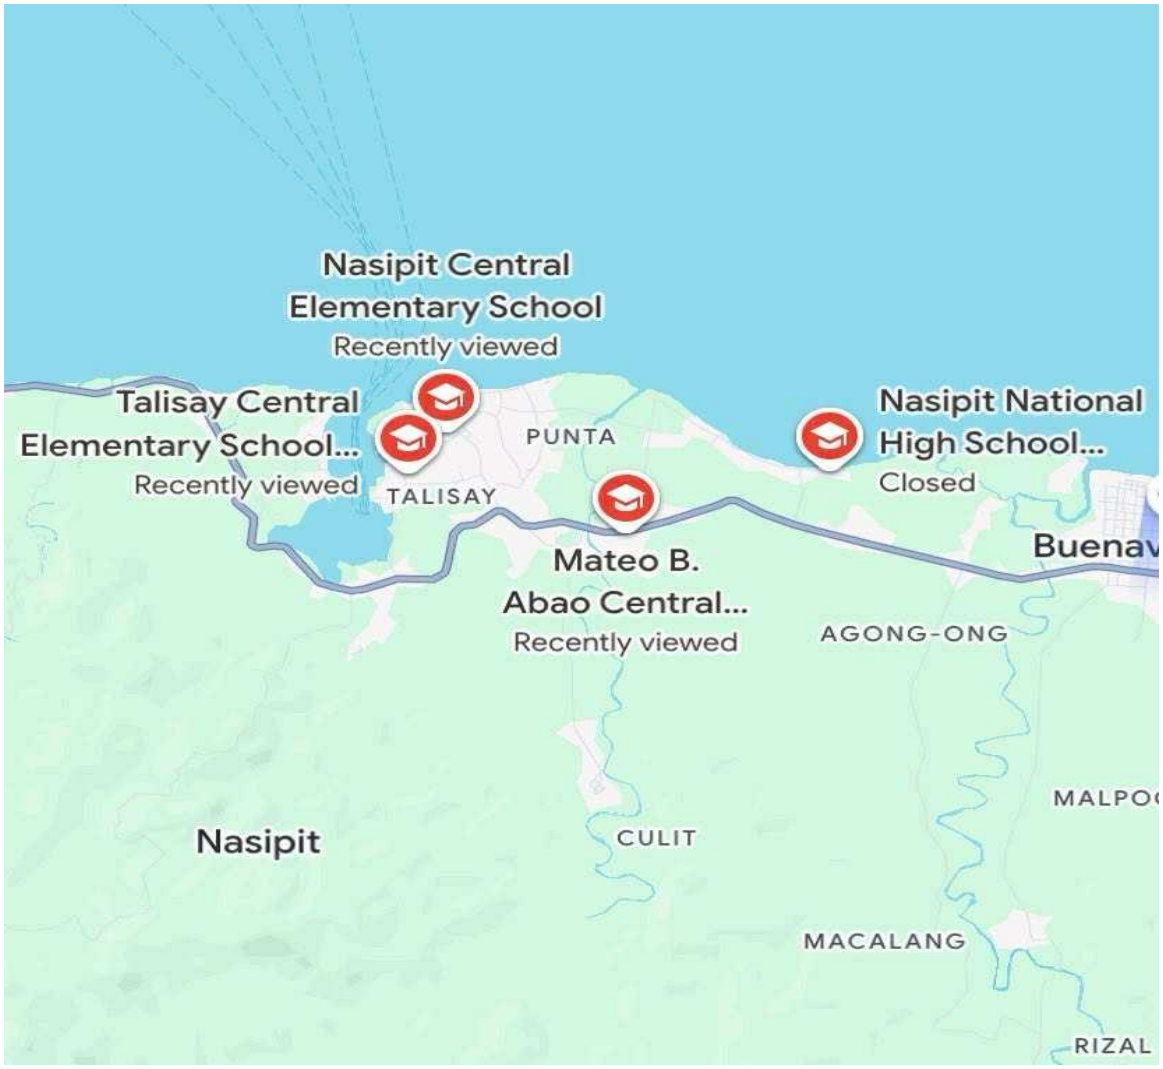

Statement	1	2	3	4
I've been getting emotional support from others.				
I've been saying things to let my unpleasant feelings escape.				
I've been criticizing myself.				
I've been getting comfort and understanding from someone.				
I've been making jokes about it.				
I've been accepting the reality of the fact that it has happened.				
I've been expressing my negative feelings.				
I've been praying or meditating.				
I've been trying to find comfort in religion or spiritual beliefs.				
I've been learning to live with it.				
I've been blaming myself for things that happened.				
I've been making fun of the situation.				

AVOIDANT COPING

Statement	1	2	3	4
I've been turning to work on other activities to take my mind of things.				
I've been saying to myself "this isn't real"				
I've been using alcohol or other drugs to make myself feel better.				
I've been giving up trying to deal with it.				
I've been refusing to believe that it has happened.				
I've been using alcohol or other drugs to help me get through it.				
I've been giving attempt to cope.				
I've been doing somethings to think about it les, such as going to movies, watching TV, or shopping.
