ABSTRACT

TITLE:	ASSESSMENT IN GREEN HUMAN RESOURCE MANAGEMENT PRACTICES AMONG SELECTED ESTABLISHMENT
AUTHOR:	SHEILA MARIE L. RIVERA, KARLA I. ADLAWAN, ROLENE MAE O. BATULAN, LIANNE SHAINE ROSE B. BERNADOS, ELLAINE JOY T. CAUSIN
DEGREE:	BACHELOR OF SCIENCE IN BUSINESS ADMINISTRATION
ADVISER:	PHOEBE KEIT S. GULLEBAN
PLACE OF PUBLICATION:	SAINT MICHAEL COLLEGE OF CARAGA
DATE	
PAGES	

DESCRIPTIVE- CORRELATIONAL

I. OBJECTIVES

The study aims to assess the implementation of Green Human Resource Management Practices (GHRM) practices among selected establishments and determine personnel's demographics and company characteristics influence their adaption.

II. METHODOLOGY

This study will involve HR head and personnel from selected establishments in BueNasCar, Agusan del Norte. Data will be collected using a structured survey. Descriptive and Correlational statistics will be use to assess the implementation of GHRM and to determine its relationship with employee and organizational factors.

III. FINDINGS

IV. RECOMMENDATIONS

CHAPTER 1

THE PROBLEM AND ITS SCOPE

1.1 Background of the study

In recent years, increasing concern about climate change and environmental degradation has pushed organizations worldwide to adopt more sustainable business practices. As noted by Chowdhury et al., (2023), Human Resource Management (HRM) refers to the general set of practices that organizations implement to manage and support their workforce. The same author further explains that Green Human Resource Management (GHRM) expands these traditional HR practices by incorporating environmental considerations into key functions. In this view, GHRM represents the alignment of conventional HR activities such as recruitment, training, performance management, and rewards with sustainability goals to promote environmentally responsible behavior among employees.

One emerging approach is Green Human Resource Management (GHRM), which integrates environmental objectives into HR functions such as recruitment, training, performance appraisal, and rewards. By encouraging environmentally responsible behavior among personnel's GHRM supports both organizational sustainability and global environmental goals. GHRM is defined as a set of HR policies and practices that promote eco-friendly behaviors and reduce the negative environmental impact of organizational operations (Faisal, 2023). As environmental challenges such as pollution, waste, and resource depletion intensify, organizations are under greater pressure to implement practices that safeguard natural resources and ensure long-term survival.

GHRM enables firms to strengthen their human capital by engaging employees in green recruitment, training, performance management, and compensation systems (Wasim Musthaq & Jegadeeshwaran, 2022).

Recent studies emphasize that aligning HR activities with environmental objectives helps embed sustainability as a shared organizational value (Siyambalapitiya & Zhang, 2024). This shift is further reinforced by global frameworks such as the United Nations' Sustainable Development Goals (SDGs), which call on organizations to integrate sustainability into their strategies and operations (Fonseca et al., 2020). In this regard, Leal Filho et al., (2023), a need for more decisive action to avoid primary challenges such as a catastrophe.

The purpose of GHRM is to create a workforce that understands, values, and practices green initiatives in the local economies of Buenavista, Nasipit, and Carmen in Agusan del Norte that are supported by a variety of establishments including small, medium, and large enterprises like tourism-related facilities, utility service providers, and educational institutions. These establishments rely on essential services such as electricity and water to maintain operations, while tourism facilities contribute to economic sustainability and educational institution in Nasipit further play an important role in contribution to workforce development and human capital formation.

It includes developing employees' green competencies and protecting intellectual and human capital through eco-friendly HR practices (Aggarwal et al., 2023). Studies across several sectors demonstrate that GHRM practices such as green recruitment and selection, green training and development, green performance management, green compensation and rewards enhance environmental responsibility, drive green innovation, and improve organizational performance (Chowdhury et al., 2025). Recognizing the value of integration of environmentally friendly practice into HRM strategies and policies (Ren & Hussain, 2022). By fostering sustainable practices is the application of Green Human Resource Management.

As the demand for sustainable business practices continues to grow, there is a need for studies that examine the actual level of Green Human Resource Management (GHRM) practices

in local organizations. Although many international and Philippine studies highlight the importance of GHRM, most research has been conducted in other regions and sectors, leaving some local areas under-studied. In Mindanao, a few studies have begun to provide regional evidence on GHRM practices. For instance, a study among small and medium enterprises in Digos City, Davao del Sur found that GHRM practices were implemented at high levels and were positively related to employee satisfaction (Alquizar et al., 2023).

Another study conducted among employees of higher education institutions in Digos City revealed that GHRM significantly influences employee green behavior, with environmental participation serving as a mediating factor (Campaner et al., 2024). Similarly, research in Mindanao State University, Marawi City showed significant relationships between GHRM practices and employee motivation, job satisfaction, and organizational commitment using structured GHRM indicators such as green recruitment, training, and employee involvement (Abdullah-Pandapatan et al., 2022)

Moreover, a recent study in Iligan City found that GHRM practices affect green employee behavior through the mediating role of green human capital, emphasizing the importance of developing employees' environmental knowledge and skills (Pontillo et al., 2025). While these studies confirm the relevance of GHRM in Mindanao, no published study has specifically adapted the GHRM practices among establishment in Nasipit, Agusan del Norte, in the Caraga Region this creates a research gap that calls for a thorough assessment of GHRM. This found the gap an absence of local evidence, that need the assessment of GHRM practices in Nasipit, Agusan del Norte using reliable and structured indicators that will provides evidence-based insights that can help organizations improve their sustainability efforts and strengthen their environmental initiatives.

Therefore, this study significantly aims to assess the implementation of Green Human Resource Management (GHRM) practices to selected establishment of the municipalities of Buenavista, Nasipit, and Carmen, Agusan del Norte containing a diverse establishment from an academic institution, a beach resort, an energy sector company, a water provider, and a recreational facility. To advance organizational sustainability by aligning human resource strategies with environmental goals. Through this assessment, the study seeks to identify organization's integrating environmental considerations into HR functions, thereby addressing both operational and environmental challenges that influence sustainable development. operations.

The findings may benefit stakeholders, as for the College of Business Management by contributing to its academic knowledge, providing additional evidence-based support for the existing curriculum, and strengthening its emphasis on strategic and sustainable HR frameworks to prepare students for their future careers. For the selected establishments may also benefit from the results of the study as it will provide an assessment regarding the implementation of GHRM Practices, identify strengths and gaps in their sustainability initiatives, and offer practical recommendations to enhance environmentally responsible HR strategies.

In addition, this study will provide a valuable resource for HR students by exposing them to the application of sustainability practices in actual organizational settings. It will develop their critical thinking skills in analyzing challenges, proposing strategies, and evaluating the effectiveness of adopting GHRM practices in human resource operations. This may support the selected establishments in improving organizational performance, strengthening their corporate sustainability efforts, and gaining a competitive advantage through the effective implementation of GHRM practices. Moreover, the study may encourage future research that focuses locally in municipalities of BueNasCar on promoting sustainability initiatives and creating organizational

policies that balance employee engagement with environmental responsibility.

1.2 Review of Related Literature

This chapter presents a focused review of related literature that supports the study of determining and assessing Green Human Resource Management (GHRM) practices. The independent variables specifically include the respondents' demographic characteristics age, sex, educational attainment, and work experience along with the company profile such as industry type, organizational size, years in operation, and ownership type (Handoyo et al., 2023). The dependent variables center on the assessment of GHRM practices, particularly the four key components: green recruitment and selection, green training and development, green performance management, and green compensation and rewards.

The study of Fawehinmi et al., (2020) emphasize GHRM plays a strategic role in sustainability, that HR departments must embed environmental principles into their functions to influence employees' green behavior and strengthen initiatives. Green recruitment ensures that organization hire individuals whose attitudes, and competencies align with environmental values. Green training strengthens employees' knowledge and skills, to contribute effectively to sustainability initiatives. Through green performance management, environmental criteria are embedded into performance appraisals to guide and reinforce eco-friendly behavior in the workplace. Meanwhile, green compensation and rewards serve as motivational mechanisms by linking both monetary and non-monetary incentives to employees' pro-environmental contributions (Chowdhury et al., 2025).

As global pressure for sustainability intensifies, organizations are increasingly adopting Green Human Resource Management to strengthen sustainable performance. To develop a green organizational culture and encourages employees to engage in environmentally responsible initiatives. Through the adoption of green practices, organizations and their employees can

strengthen environmental awareness, encourage eco-friendly behaviors, and integrate sustainability into everyday operations. These efforts collectively enhance sustainability-oriented performance, making the assessment of GHRM practices crucial for understanding how organizations can effectively achieve long-term environmental goals (Ali et al., 2024).

GHRM literature provides the foundation and emphasizes the role of HR practices in shaping employees' environmental responsible behavior. Within organizational settings, two key forms of green behavior are commonly identified: Voluntary Green Behavior (VGB), which involves discretionary pro-environmental actions beyond formal job requirements, and Task-related Green Behavior (TGB), which refers to the integration of sustainability-oriented actions within employee' assigned duties. Empirical evidence demonstrates that GHRM positively influences both forms of behavior through direct effects and through mechanisms embedded in HR processes (Ali et al., 2024).

Sustainable strategies emphasize minimizing environmental impact through resource efficiency, waste reduction, the use of renewable energy, and environmentally responsible supply chain practices (Dzetsko, 2024). As the HR function strategically embeds environmental values into organization's culture and daily operations. Previous studies show that GHRM improves organizational, economic, and environmental performance (Obeidat et al., 2020). That help reduce negative impacts such as excessive energy use and harmful emissions (Doghan et al., 2022).

Recent studies from 2021 onward consistently show that green recruitment and selection help organizations attract applicants who value the environment. (Zhu et al., 2021, Singh et al., 2022, and Hira et al., 2023) found that using environmental criteria in hiring helps organization selected applicants with strong green values. Similarly, green training and development provide employees with the knowledge and skills needed to support sustainable practices. Studies by

(Amrutha & Geetha, 2020) and (Nasr et al., 2022) show that environmental training improves employees' awareness, creativity, and involvement in green activities and that green performance management increases environmental responsibility.

Saeed et al., (2022) found that incorporating environmental standards into performance evaluations encourages employees to consistently engage in eco-friendly behaviors. Similarly, green compensation and rewards play a crucial role in motivating employees to adopt sustainable practices. Studies by Muisyo et al., (2021), Pham et al., (2020), and Das & Dash, (2024) shows that linking incentives to environmental achievements enhances employee participation in ecological activities. Followed by recent researches of Hameed et al., (2022); Kuo et al., (2022); Mustafa et al., (2023); Ahmad & Hayee, (2024) emphasizes that it fosters a workforce committed to environmental responsibility, drive green innovation, and improve organizational performance, making sustainability an integral part of HR management.

As these practices encompass green recruitment and selection, which prioritize hiring employees with pro-environmental values; green training and development, which enhance employees' environmental awareness and green competencies; green performance management, which evaluates employees based on their contribution to sustainability goals; and green compensation and rewards, which incentives eco-friendly behaviors and achievements.

Green HRM Practices

The exploration of Nguyet, (2025) on Green Human Resource Management (GHRM) as a modern approach that integrates environmental sustainability into HR policies and practices, aligning organizational strategy with ecological imperatives. The study systematically reviews academic literature and examines illustrative case studies to highlight the concept, key components, drivers, challenges, and outcomes of GHRM. Key practices identified include green recruitment, training, performance management, compensation, and employee involvement, all

of which are shown to promote organizational sustainability by reducing waste, enhancing efficiency, and encouraging pro-environmental behaviors among the organization and its employees.

Major drivers of GHRM adoption include regulatory pressures, stakeholder and consumer expectations, competitive advantage, and growing environmental awareness, while barriers include limited resources, low management competence, lack of incentives, and entrenched economic-centric organizational culture. Correlations between GHRM practices and triple-bottom-line performance, whereas cases such as Philippine Airlines illustrate the importance of fully integrating HR systems with sustainability objectives. The study concludes that effective GHRM contributes to environmental performance through resource efficiency and pollution reduction, economic performance via innovation and cost savings, and social performance.

Through emphasizing organization embedding green criteria across all HR functions and foster a supportive culture to achieve these outcomes. Conducted by Maurya et al., (2025) an comprehensive literature review on GHRM practices, focusing on the identification of key practices, their attributes, and the methodologies used to assess them. Their review synthesizes existing research, with particular emphasis on how GHRM is applied within manufacturing organizations, and highlights essential practices such as green recruitment, green training, green performance evaluation, and green compensation. The authors analyze the characteristics of these practices as

Described across the literature, noting how they contribute to organizational sustainability through employee engagement and environmentally responsible behavior. Moreover, the study provides an overview of assessment methodologies commonly used to evaluate GHRM implementation, including the Best–Worst Method (BWM) and the Fuzzy Technique for Order Preference by Similarity to Ideal Solution (TOPSIS), both recognized for their effectiveness in

ranking and measuring sustainability-oriented HR initiatives. Also Shahrulnizam et al., (2024) conducted a systematic literature review examining the roles of GHRM in advancing sustainable organizational practices across various industries.

By synthesizing 35 academic articles, the authors highlight how key GHRM components—such as green recruitment, green training, green performance management, green compensation and rewards, and green employee engagement are increasingly integrated into organization strategies as it prioritizes environmental sustainability. The review emphasizes that these practices significantly contribute to improved environmental performance by encouraging pro-environmental behavior, enhancing operational efficiency, and embedding sustainability values into organizational culture. However, the study also identifies persistent challenges hindering GHRM adoption, including insufficient leadership commitment, limited financial and human resources, and cultural resistance within organizations.

The authors underscore the importance of aligning GHRM initiatives with broader strategies, strengthening leadership involvement, and establishing standardized metrics to evaluate sustainability outcomes. They further recommend that future research focus on industry specific barriers, cultural influences on GHRM effectiveness, and the potential of digital technologies to support green HR initiatives. Provided by Faisal & Naushad, (2020) an important contribution for assessing of GHRM within small and medium enterprises, particularly in the context of Saudi Arabia. Their study highlights that GHRM has become a critical driver of sustainable competitiveness for modern organizations, yet SMEs often face constraints.

Such as limited financial resources and insufficiently developed HR departments that hinder full implementation of green practices. Using the Analytical Hierarchy Process (AHP) as a multi-criteria decision-making tool, the researchers examined the priority areas of GHRM among facility management SMEs in Riyadh. The findings reveal that SMEs place the lowest emphasis on

green HR acquisition, showing limited focus on integrating environmental criteria in recruitment. However, they show moderate concern for green orientation, training, and development, indicating an awareness of the need to equip employees with environmental knowledge and skills.

As the top priority, suggesting that SMEs value long-term employee commitment to sustainability initiatives. Overall, this research underscores that while SMEs recognize the strategic importance of GHRM, their implementation levels vary, emphasizing the need for more structured HR systems and stronger managerial commitment to fully realize GHRM's sustainability potential most notably, the study identifies retention of highly competent employees in green HR practices. As identified by Wisetsri et al., (2022) Green Human Resource Management integrates environmental sustainability into key HR practices, the following sections define each GHRM practice in detail:

Green Recruitment & Selection

To begin with, HR must ensure that each stage of candidate evaluation examines the applicant's commitment to eco-friendly actions. Furthermore, after the initial resume screening, interview questions should highlight environmental awareness, sustainable decision-making, or group tasks that reflect corporate sustainability values. In addition, candidates may be assigned a "green score" at the end of the assessment, which is combined with other scores to determine the most suitable applicants who support organizational environmental goals. The green recruitment (GR) concept involves selecting and hiring individuals with knowledge, competencies, techniques, and attitudes that are compatible with a particular organization's environmental management systems.

As emphasized by Sandi et al., (2021), any recruitment professionals are enthusiastic about working for organizations that promote environmentally conscious recruitment practices and candidates increasingly prefer employers with strong green HR policies (Jamil et al., 2023).

However, Wang et al., (2024) reported that green recruitment and selection (GRS), a key GHRM practice, is often implemented for short-term benefits, such as saving time and costs, while long-term benefits, such as saving time and costs, while long-term advantages, including employee satisfaction, are frequently overlooked. Challenges such as misaligned job roles and green practices, as well as a profit-focused organizational orientation.

In the research conducted by Alegre, (2025) the study examined how Philippine Airlines uses Green HRM practices. Found that green recruitment and training are done well, but performance reviews and employee participation in sustainability are not consistent, which affects employee motivation. The study suggests that aligning HR practices with environmental goals, enhancing performance reviews, and increasing employee involvement can strengthen employee commitment and support sustainability. PAL's approach can serve as a model for other service organizations seeking to incorporate sustainability into their HR practices. To the study of Jamil et al., (2023), thoroughly examines the concept of green recruitment (GR) and its subsequent impact on organizational sustainability performance (OSP).

This study emphasizes the crucial importance of integrating sustainability into recruitment processes. Greening the recruitment process involves implementing sustainable practices in attracting and hiring employees. One example is virtual hiring, which allows organizations to reduce paper use and other resource consumption, representing a step toward environmental sustainability (Kaur et al., 2022). Further impact of the virtual mode of hiring as green HR practice on cost-effectiveness, geographical outreach and environment/health benefits. This study confirms that the technology acceptance model accurately depicts users' behavior toward technology, and studies are available that demonstrate this.

Green Training & Development

Green training focuses on improving employees' knowledge, skills, and attitudes toward

environmental sustainability. Leaders should provide structured training programs that enhance workers' competencies in ecological responsibility. Utilizing of virtual platforms, online modules, and multimedia tools to deliver environmental training effectively. These programs may cover topics such as energy conservation, waste reduction, recycling, and sustainable resource management. As a result, employees become more motivated and better equipped to contribute to a more environmentally responsible organization.

Asserted by Begum & Kavitha (2023), those who examined green training and development, is a key Green HRM practice that positively impacts employee performance. Training employees on environmental awareness, sustainable resource use, waste reduction, energy conservation, and water efficiency enhance their performance and productivity. Green training not only helps employees understand and value environmental practices but also encourages green innovation and strengthens their commitment to sustainability goals. Integrating green training into HRM processes therefore supports both organizational sustainability and employee effectiveness.

As identified by Huelgas & Arellano (2021), the impact of green transformational leadership, green HRM practices, and green on the environmental performance of Philippine Ports Authority offices found that leaders motivated employees to engage in sustainable behaviors. HR practices, including training, organizational culture, and performance management, supported employees in working in environmentally friendly ways. However, the use of rewards and employee participation in green initiatives was less common. Additionally, green innovations, largely driven by regulatory requirements, contributed to improved environmental performance. Overall, the study highlights that effectiveness of leadership and integrating green innovation collectively empower employees to act sustainably and enhance the effectiveness of green training in public sector offices and into everyday business operations.

Green training and development practices have been recognized as effective tools for

addressing environmental challenges and promoting the acceptance of conservation in the workplace. In the long run, these practices create a win-win situation for both management and employees. Which serves as a key indicator of environmental sustainability that essential for fostering employees' consciousness and commitment toward achieving sustainable development goals. Therefore, employee engagement and participation in green initiatives should be prioritized and continuously strengthened through regular training and development programs focused on attaining organizational green objectives (Moradeke et al., 2021).

Green Performance Management

Evaluating employees based on sustainability-related criteria. Thus, performance appraisal should incorporate measurable environmental objectives to help establish a greener organization. Additionally, managers may assess employees based on their contribution to green initiatives, participation in ecological activities, and efforts to raise environmental awareness in the workplace. Therefore, integrating sustainability indicators into the appraisal system ensures that green behavior becomes a standard component of organizational performance.

Based on the study of Rehman et al., (2023) they investigated the impact of green supply chain practices and green culture on green performance in manufacturing firms. They found that green culture helps improve performance, while supply chain practices alone do not. Environmental strategies (PES) and green product innovation (GPI) help transform green practices and culture into tangible results by guiding management and enhancing products and processes. The study shows that strong green culture, planning, and Innovation together are keys to better environmental performance.

In a study by Martins et al., (2021), an emerging managerial challenge for all organizations is to protect natural resources by reducing their negative impact on the environment and increase sustainable performance greening is the need of the to conserve natural resources. Recent

literature of Gomes et al., (2024) continues to shed light on how green performance management the appraisal and evaluation of employees based on environmental criteria serves as a critical mechanism in Green HRM for driving sustainable and green outcomes in Portuguese tourism organizations when employees feel emotionally attached to the organization, they are more likely to translate green HR policies into sustainable behaviors and found that it significantly improves eco-friendly behavior with affective commitment acting as a mediating factor.

In a recent empirical study of Makumbe, (2024) demonstrates that green performance in small- and medium-sized enterprises (SMEs), by aligning individual performance evaluation with ecological objectives. His findings, suggesting that HR practices stimulate innovative, eco-friendly ideas that in turn enhance environmental outcomes that green HRM framework isn't just about measuring environmental behavior it's also about cultivating a culture of knowledge sharing and innovation. Complementing Makumbe's work, other scholars have similarly emphasized the mediating role of green innovation in connecting HR practices to environmental performance.

As a strategic HR practice that links performance evaluation to environmental objectives, and they underline the critical roles of innovation and knowledge sharing in realizing the performance benefits or performance appraisal as systematic evaluation of an employee's job performance and contributions to the organization's GHRM influences sustainable performance through green product and process innovation (Zihan & Makhbul, 2024).

Green Compensation & Rewards

Designing incentive systems that motivate environmentally responsible behavior. Reward packages may include monetary benefits, such as bonuses, non-monetary recognition like certificates, or managerial incentives linked to environmental performance. Compensation can also be tied to specific sustainability indicators, such as reduced carbon emissions, improved waste management practices, or increased use of renewable resources. By acknowledging and

rewarding employees who successfully achieve green targets, organizations reinforce environmentally responsible behavior and promote a culture of sustainability.

Green reward, compensation, and development practices contribute to long-term organizational sustainability. For example**,** green job descriptions are provided for all employees, which demonstrates that organizations have implemented green reward, compensation, and development strategies to support their long-term sustainability goals (Rivaldo & Nabella, 2023). The study by Putra & Asnur, (2020), found that employees at the Premier Basko Hotel were moderately satisfied with their jobs. They were most satisfied with salary and supervision, but least satisfied with promotion opportunities due to limited career growth and unclear promotion systems.

As highlighted by Baqi & Indradewa, (2021), a study on the effect of compensation on job satisfaction among permanent and contract employees of Alfamart in West Bekasi found notable differences in compensation between the two groups, particularly concerning job status and length of service. Compensation plays a key role in motivating employees to engage in sustainable and responsible work practices. Ensuring fair pay, recognition, and leadership support through green compensation and reward systems encourages employees to actively participate in sustainability initiatives. When salaries and bonuses are equitable and linked to environmental performance, employees become more engaged and committed to achieving green organizational goals.

In the research of Das & Dash, (2024), investigated the role of green rewards and compensation in promoting environmental sustainability and enhancing employee performance in ISO 14001-certified manufacturing organizations. The findings revealed that green rewards and compensation encourage employees to engage in pro-environmental behaviors, improve job satisfaction, and develop green-related skills. These practices contribute to fostering long-term

organizational sustainability. The study emphasizes that integrating green rewards into HRM not only motivates employees but also strengthens the organization's environmental performance, making it an effective tool for sustainable growth.

According to Nawafleh (2020), found that in Pakistan's textile industry, green reward systems significantly enhanced both employee environmental performance and job satisfaction. Locally, Zafra & Guballo (2025), reported that BPO firms in Makati implementing green rewards experienced increased employee engagement and reduced absenteeism. Similarly, Irani et al., (2022) observed that hotels offering eco-performance incentives achieved higher customer satisfaction and improved sustainability ratings. These studies collectively highlight the effectiveness of green reward systems in promoting sustainable behavior, enhancing employee performance, and improving organizational outcomes across various industries.

Age

Age plays a crucial role, as it significantly influences the profile of HR personnel and employees in shaping their participation in environmental initiatives. Studies indicate that individuals within the 26–30 age range are particularly responsive to green HR practices, suggesting that organizations should design programs tailored to the preferences and motivations of this demographic (Saha et al., 2025). Empirical evidence supports this notion, Kalla and Agrawal (2025) found that employees aged 26–30 demonstrated higher organizational commitment when involved in green HR initiatives, emphasizing the importance of age-sensitive strategies in promoting sustainability.

Similarly, Zihan et al. (2024), in a study published in Sustainability, identified age as a key variable affecting employees' responses to GHRM practices. Zhu et al. (2021) also included age categories as a control variable when examining the relationship between GHRM and employee green behavior, demonstrating the impact of age on environmentally responsible workplace

behavior. Collectively, these studies underscore the importance of demographic factors, particularly age, for the effectiveness of implementation of GHRM. Recognizing the age distribution of HR personnel and employees enables organizations to design green HR practices that are more targeted, thereby enhancing employee engagement and fostering greater commitment to sustainability initiatives.

Sex

As reported by Poquiz et al., (2023) a crucial demographic factor influencing GHRM practices and employees' participation in environmental initiatives. The article of Segbenya et al., (2024) highlights that male and female may exhibit differences in their attitude, motivation, and levels of engagement with sustainability programs. HR managers should consider differences when integrating environmental sustainability into core HR functions. Promoting an inclusive organizational culture that values sex perspectives can strengthen commitment and enhance pro-environmental behavior. Locally, a study by M. Huelgas and A. Arellano, (2021) on GHRM in Philippine port management offices revealed that female employees were more active in sustainability training and environmental awareness campaigns.

Zafra & Guballo, (2025) also found that in BPO firms, female demonstrated higher engagement in green HR activities compared to their male counterparts. These findings suggest that sex diversity in the workplace strengthens the overall success of GHRM implementation.

For instance, Saputri & Nawangsari, (2024) conducted a quantitative study using SEM-PLS with 130 respondents and found that GHRM positively influences corporate sustainability via employee green behavior for both female and male, but their analysis shows sex-based differences in the strength of these effects. In another important study, Sultan & Zardari, (2024) explored a moderated-mediation model of GHRM's impact on green behavior with sex as a moderator and support as a mediator to organization.

While GHRM showed a positive effect on both in-role and extra-role green behaviors, sex did not significantly moderate all these relationships, suggesting that the impact of GHRM may be broadly similar across in some contexts. Segbenya et al., (2024) investigated the moderating role of sex on the relationship between GHRM practices and employees' personal environmental norms in a developing economy. Khan et al., (2022) also examined how GHRM, green knowledge sharing, and green commitment influence green behavior. They found that it significantly moderate, indicating that male and female employees internalize environmental norms differently under green HRM practices.

Veerasamy et al. (2024) conducted a conceptual study on GHRM practices and employee green behavior in India, using a three-way moderation model that provides a strong foundation for understanding how HR green practices translate into green actions. As well Islam et al., (2023) examined finding that sex (male vs. female) in GHRM practices and sustainable organizational performance in Bangladesh. Their work highlights that employee sex, may influence the effectiveness of GHRM, although empirical testing as a moderator remains limited. It significantly moderates the impact of green HRM practices on sustainable outcomes, particularly when combined with employee championing behavior.

Educational Qualification

As observed by Abun et al., (2021), employees with higher levels of education and more years of work experience tend to have stronger self-confidence in their job performance, making them more capable and motivated at work. In the context of Green Human Resource Management, educated and experienced employees are more likely to understand, support, and actively participate in environmental programs within the organization. They can readily engage in green practices and contribute to promoting sustainability at the workplace. Therefore, education and experience play an essential role in enhancing the effectiveness of GHRM, as

educational attainment significantly influences how employees comprehend and implement green HRM policies.

According to Lewandowska & Stopa, (2020) importance of formal education and innovative professional qualifications in shaping workforce capabilities and enhancing organizational effectiveness. Based on a survey of 10,906 Polish working-age individuals, the study found that while advanced qualifications in engineering and science do not always guarantee a greater sense of job security, they equip employees with essential knowledge, technical skills, and adaptability. In the context of HRM practices, this underscores the value of hiring and developing employees with relevant educational backgrounds, as such qualifications enable individuals to perform specialized tasks, contribute, and adopt innovative processes.

This finding aligns with research demonstrating that practical work experience enhances employee performance. Together, these studies suggest that both educational qualifications and professional experience are critical factors for improving productivity, efficiency, and overall organizational success. Educational qualifications can also influence how employees respond to Green Human Resource Management practices. For instance, Zahrani (2024) found that in a higher education context, almost all respondents (95.6%) held a PhD, indicating that GHRM in academic settings often involves highly educated individuals who may possess a stronger understanding of environmental sustainability.

From a different perspective, Zhu et al., (2021) measured education as part of their controls, observing that employees with higher educational attainment (bachelor's degree and above) made up more than half of their sample, and they explicitly controlled for education because it "affects employees' environmental attitude." Emphasized by Saifulina et al., (2020) that sustainable HRM and GHRM practices can direct even well-educated employees toward pro-environmental behavior through recruitment, training, and performance management.

On a broader institutional level, Nawafleh, (2020) studied GHRM practices in Jordanian educational institutions, showing the relevance of integrating green HR strategies in organizations.

Where education is core to mission, Liang et al., (2023) included “education” as a control variable in its regression analysis, finding that higher educational level was positively related to employee green behavior, mediated by green climate and green HRM practices. Studied green HRM practices in Pakistan’s higher education sector and found that education level (e.g., having postgraduate degrees) was a significant part of demographic profile, which may affect how employees engage in green engagement and green behavior to influence environmental performance (Adeel et al., 2024).

Work Experience

According to Goyal et al., (2023) investigates the relationship between work experience, compensation, and employee performance in growing companies across technology, retail, and manufacturing sectors. Using a quantitative survey of 100 employees, the research demonstrates that work experience is a critical factor influencing employee performance, even more so than compensation. Employees with relevant experience are generally able to perform their tasks more efficiently, produce higher-quality work, and adapt more quickly to organizational demands. The regression analysis in the study confirms that work experience has a stronger impact on performance outcomes compared to compensation, highlighting that knowledge, and skills.

Gained from previous roles are key drivers of productivity, finding underscores the importance for companies to prioritize experienced employees, provide experience-based training, and leverage employee expertise to enhance organizational efficiency and achieve business objectives. It also implies that while competitive compensation is important for motivation, practical experience directly equips employees with the competencies needed to contribute effectively to the company’s growth and operational success.

Work experience is the process of developing one's work experience through many things that cannot be limited and calculate (Wang et al., 2022).

Process of establishing knowledge or skills about the methods of a job due to the involvement of the employee in the implementation of work tasks (Liang & Wu, 2022). Having worked for a long period of time, a person's job experience includes the knowledge and abilities they've gained through that time, by paying attention to employee work experience then the company can determine a position or position that is in accordance with their expertise (Van Overmeire et al., 2021). Work experience is a measure of the length of time or work that a person has taken in understanding the tasks of a job and has done well (Cheng & Cho, 2021).

Employee work experiences in carrying out task in an organization is very important role. Those has more work experience will certainly better understand what to do when facing problems. Measures of how much time and effort a someone has put in to learn the responsibilities of a job and do them well (Kim et al., 2021). The research of Yadav & Dhar, (2021) provides evidence that experienced employees perform better because they have a greater knowledge base to improve their performance. These advantages are useful for developing skills to have good performance. Various kinds of experiences that individuals have seen as indicators knowledge and skills.

Industry Type

GHRM adoption varies by industry manufacturing firms implement more formal and structured green HR practices due to higher environmental and regulatory pressures, whereas service and IT sectors emphasize behavior-oriented initiatives (Maheshwari & Buddhapriya, 2025). On the hospitality and tourism sector, particularly in hotels, beach resorts, recreational facilities, green HR practices such as recruitment, training, and appraisal strongly influence employees' green innovative work behavior and overall environmental performance (Khan et al.,

2025). Research in Egyptian hotels indicates that GHRM positively influences corporate social responsibility performance, particularly when combined with green training and environmentally focused recruitment practices (Elshaer et al., 2023).

However, cost constraints, limited awareness, and insufficient budget often act as barriers to full adoption of GHRM in these facilities (Sobaih et al., 2020). By contrast, in the manufacturing sector, bibliometric studies reveal increasing adoption of GHRM since 2020, focusing on sustainability integration, employee engagement, and digital transformation (Austen & Piwowar-Sulej, 2024). Sectoral differences in GHRM implementation are also shaped by regulatory and environmental pressures, with hospitality and recreational sectors often facing stricter environmental regulations, which encourages the adoption of more structured and formalized GHRM practices (Susanto et al., 2022).

Point out by Tanveer et al., (2023), the hospitality industry's adoption of environmentally friendly practices helps top management and policymakers maintain a balance between economic, environmental, and social responsibility. Moreover, the environmental goals and values of hotels are critical in addressing sustainability challenges, as they guide decision-making and strategic planning. The authors emphasize that achieving these requires continuous training programs to raise awareness and build competencies, hotels can strengthen their commitment to environmental sustainability.

Company Size

Firm performance is significantly shaped by structural factors such as the business sector, firm age, foreign ownership, and financial leverage. Demonstrates organizational characteristics influence operational outcomes, with older firms and certain sectors showing stronger performance due to accumulated experience, resource availability, and established systems (Mallinguh et al., 2020). These insights are particularly relevant for assessing Green Human

Resource Management (GHRM) practices, as the adoption and effectiveness of environmentally oriented HR strategies are similarly influenced by firm-level characteristics. Younger firms or those operating in resource-constrained sectors may encounter greater challenges in implementing green training, green performance standards, or other sustainability-focused HR initiatives.

Firms with limited financial resources, small workforces of fewer than 50 employees, and underdeveloped organizational systems often struggle to implement comprehensive practices, such as formal green training programs, eco-focused performance appraisals, or reward systems for environmentally responsible behavior. As a result, employees in these organizations may receive minimal guidance or incentives to engage in sustainable workplace practices, such as energy conservation, recycling, or waste reduction initiatives. In contrast, larger firms with higher financial capacity, well-established organizational structures, or foreign ownership are better positioned to adopt advanced GHRM systems.

These organizations can systematically integrate HR strategies with international sustainability standards, providing structured environmental training, formal performance evaluations linked to green objectives. Consequently, employees in such firms are more likely to be engaged, motivated, and equipped to contribute effectively to the organization's environmental sustainability goals. According to Li & Rees (2021), larger SMEs are more likely to formalize HRM practices because they possess greater financial and administrative resources that allow them to develop structured systems such as policies, dedicated HR units, and formal procedures.

Similarly, to Wickramasinghe (2022), found that in Sri Lankan SMEs, firms with higher HRM greater systematic use of HR practices SMEs' ability to implement comprehensive green initiatives practices and limited resources constrain leading to fragmented or informal approaches. Suggesting that formalization increases as firms grow this size-related difference also affects the

adoption enable to institutionalize (Elshaer et al., 2023). Meanwhile, research on SMEs shows that while small businesses do adopt green practices, these are often selective and informal for example, on Elshaer et al., (2023), found that GHRM in small lodging enterprises is shaped more by owner-manager values than formal policies, and (Sobaih et al., 2020).

Years in Operation

Argued by Ellingrud et al., (2020) that the rapid automation and digitization are reshaping the future of work, requiring organizations to upskill and reskill their employees to remain competitive. This shift is highly relevant to the assessment of Green Human Resource Management practices, as the transition toward environmentally sustainable operations similarly demands new employee capabilities, green competencies, and adaptive organization's cultures. As operationally intensive sectors reconfigure their systems in response to technological change and post-pandemic pressures, employees must be equipped not only with digital skills but also with knowledge and behaviors supportive of environmental responsibility.

The authors note that organizations are generally unprepared for these workforce transitions, which parallels findings in GHRM literature showing that many establishments struggle to institutionalize green training, green performance metrics, and long-term sustainability-oriented workforce development. Therefore, the insights of Ellingrud et al., (2020) reinforce the importance of evaluating how establishments integrate skill-building particularly green-related skills into their HR practices, as this capability is crucial for both navigating the automation revolution and achieving sustainable organizational performance.

Ownership Type

Defined as the legal and structural control of an organization, is an important organizational characteristic that can shape the adoption and implementation of GHRM practices. Ownership type typically includes private, public, family-owned, and government-owned

organizations, each with distinct decision-making processes, resource allocation, and strategic priorities (Phuong, 2020).

In the study of Abuladze & Skorková (2021) explain that HRM has undergone substantial evolution in both its roles and its organizational positioning over time. Initially emerging during the industrial revolution, HRM began as the role of a welfare officer, tasked with ensuring basic employee well-being through functions such as hiring, firing, disciplining, rewarding, and policy development.

Although these welfare officers laid the groundwork for modern HRM roles as administrative experts, they had limited authority and were typically integrated within financial or operational departments rather than existing as independent units. The focus during this stage was on addressing basic employee needs while maintaining productivity, marking the beginning of HRM's formalized contribution to organizational structure. Investigated by Aburahma et al., (2020) the relationship through a case study conducted at Gaza University in Palestine. The study employed a complete census of 100 employees and utilized questionnaires as the primary tool for data collection, applying both descriptive and quantitative approaches.

Along multiple dimensions, the shift from private to public status resembles a gradual transition rather than a regime shift (Lowry, 2023). The findings revealed a statistically significant relationship between GHRM practices and organizational performance, indicating that effective green HR initiatives can positively influence institutional outcomes. However, the study also identified gaps in current practices, noting that the university lacked a clear vision regarding environmentally conscious selection procedures and that employee training programs did not adequately incorporate environmental considerations.

Based on these findings, the authors recommended implementing continuous efforts to enhance environmental awareness among staff, encouraging the university to adopt more

GHRM practices through incentive-based compensation plans, and integrating environmental performance evaluation into regular job assessments. Additionally, they emphasized the importance of aligning university performance evaluation models with environmental management goals and establishing clear green objectives to develop and sustain environmental achievements.

Private companies are staying private longer and increasingly resemble public firms. There is growing overlap in the sources of capital used by both private and public companies, and corporate governance structures, such as Boards of Directors, evolve before and after IPOs. As private firms grow larger with more dispersed ownership, their governance demands become similar to those of public firms, continuing to evolve throughout the firm's life cycle. While IPOs were traditionally used to gain acquisition currency, firms are increasingly pursuing acquisitions prior to going public. Macro-level changes that reward economies of scale and scope, along with greater access to capital, enable private firms to achieve rapid growth before an IPO.

1.3 Theoretical Framework

This study will be anchored on these guiding theories, Resource-Based View (RBV) and AMO Theory (Ability–Motivation–Opportunity) explain how environmental sustainability can be integrated into human resource practices. Organizational resources such as trained staff, leadership commitment, and green policies support the implementation of GHRM practices fostering employee commitment to sustainability while enhancing competitive advantage.

Resource-Based View (RBV) Theory

The Resource-Based View (RBV) theory defines as strategic management framework introduced by several novel protagonists, including Barney (1991), Amit & Schoemaker (1993), by emphasizing that an organization's internal resources, particularly its human capital resources, are essential for achieving sustainable competitive advantage. Emphasizes the role of a company's

internal resources and capabilities in achieving and sustaining competitive advantage. By integrating employees' skills, knowledge, motivation, and green capabilities with organizational resources to drive eco-friendly practices and sustainable performance (Yusliza et al., 2017 ; Wen et al., 2022 ; Ren et al., 2020 ; Yong et al., 2019).

Stated by Chowdhury et al., (2020) and Islam et al., (2022), learning how to reduce harm to resources by finding better ways to perform in a more sustainable way. By assessing establishments, manage their resources for achievable sustainable performance. The adaptation of Green HRM, enhancing eco-efficiency, maintaining green competitiveness, and promoting sustainable performance (Sathasivam et al., 2020). In line with the study, GHRM practices are viewed as strategic tools for developing employees' environmental knowledge, skills, and behaviors that are valuable and difficult to imitate. Therefore, RBV supports the importance of assessing GHRM practices among selected establishments, as these practices strengthen internal capabilities that promote environmental sustainability and improve organizational performance in the long term.

AMO Theory (Ability–Motivation–Opportunity)

The AMO Theory, define as a framework in strategic human resource management that explains how HR practices influence employee performance and organizational performance aimed at enhancing workforce characteristics, has emerged as an important option to support employee attitudes, encourage innovation and foster productive behaviors. Developed by Appelbaum et al., (2000) explains that employee performance depends on three factors: Ability (skills and knowledge), Motivation (willingness to work), and Opportunity (the chance to use skills effectively).

Firstly, ability practices refer to the knowledge, skills, and talents employees have to do their jobs well. It includes both natural talents and learned skills to perform their tasks efficiently

it encompasses both natural talents and acquired expertise. Secondly, motivation is the willingness of employees to work hard to help the organization reach its goals. It includes both internal drives, like personal satisfaction, and external rewards, like bonuses or recognition (Anwar et al., 2020). At last, opportunity practices giving employees the chance and support to use their skills and motivation at work. It includes having the right resources, tools, and freedom to do their jobs effectively (Marin-Garcia & Tomas, 2016).

Organizations can improve performance by building employees' abilities, encouraging motivation and providing opportunities to participate. The work of Pontillo et al., (2025) titled "The Mediating Role of Green Human Capital in the Relationship Between Green Human Resource Management Practices and Green Employee Behavior for a Sustainable Future**"** applied AMO framework. Therefore, this support as the pathway through linking organization's practices with pro-environmental behavior. Provide guidance on how to design policies and programs that develop green competencies, encourage environmentally responsible behavior, and to create opportunities for employees to contribute to sustainability.

1.4 Schematic Diagram

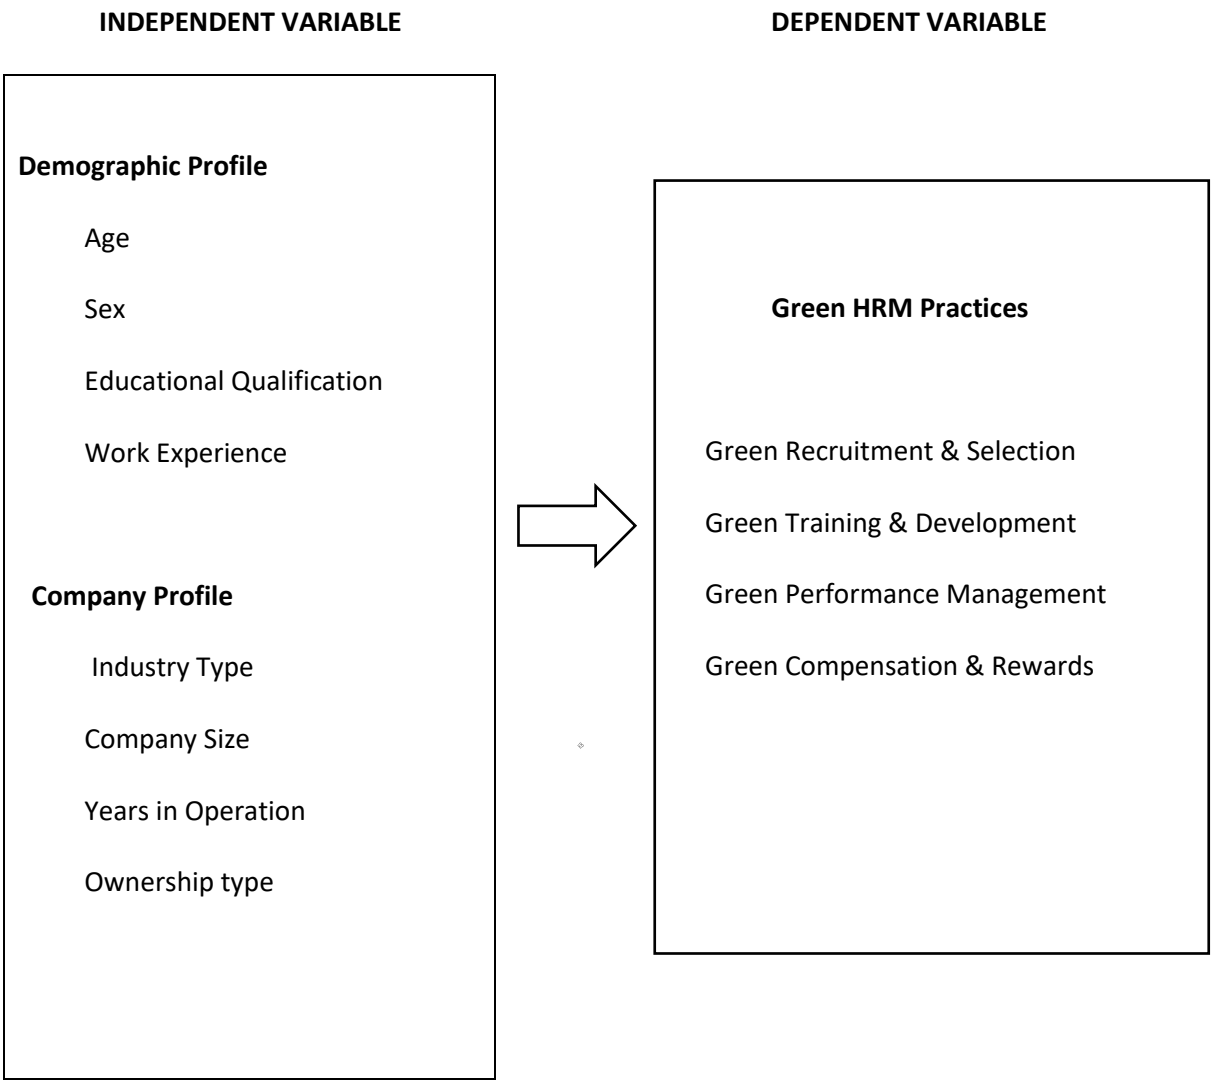

Figure 1. Interplays the independent and dependent variables of the study.

1.5 Statement of the Problem

The study aims to assess the implementation of Green Human Resource Management (GHRM) practices among selected establishments and determine employee's demographics and company characteristics influence their adoption. Specifically, seeks to answer the following questions:

1.What is the demographic profile of the respondents in terms of:

1.1 Age

1.2 Sex

1.3 Educational Qualification

1.4 Work Experience

2. What is the company profile of the respondents' organizations in terms of:

2.1 Industry Type

2.2 Company Size

2.3 Years in Operation

2.4 Ownership Type

3. To what extent have selected establishments implemented Green Human Resource Management practices, terms of:

3.1 Green Recruitment and Selection

3.2 Green Training and Development

3.3 Green Performance Management

3.4 Green Compensation and Rewards

4. Is there a significant relationship between the Demographic Profile and Company Profile to GHRM practices?

1.6 Hypothesis

H_o: There is no significant relationship between the demographic profile of employees, company profile and the level of implementation of Green Human Resource Management (GHRM) practices.

H_{o1}: There is a relationship between the demographic profile, company profile and the level of implementation of Green Human Resource Management (GHRM) practices.

Scope and Limitation

This study will investigate the level of implementation of Green Human Resource Management (GHRM) practices and personnel's demographics and company characteristics influence the adoption among selected establishments in Buenavista, Nasipit, and Carmen, Agusan del Norte. Focuses on demographic factors such as age, sex, educational background, job position/level, and employment status, as well as company characteristics including industry type, organization size, years in operation, and ownership type. The researchers intend to use stratified sampling by dividing the population into distinct strata based on establishment type includes beach resorts, company in the energy sector, a water provider, and recreational facilities and academic intuition.

1.7 Definition of Terms

For better understanding, the following terms are functionally specified as follow:

Age. The employee's numerical age, measured in years, used to assess differences in responsiveness to Green HRM initiatives.

Company Size. The total number of employees in the organization, indicating capacity to implement structured Green HRM practices.

Educational Qualification. The highest education level attained by employees, influencing their understanding and engagement in sustainability-related HR programs.

Employee Green Engagement. The degree to which employees actively participate in environmental activities and support workplace sustainability efforts.

Environmental Compliance. The organization's adherence to environmental regulations and standards, reflecting alignment with sustainable HR practices.

Environmental Policy Awareness. The extent of employee knowledge about the organization's environmental guidelines and green initiatives.

Green HRM Practices. HR strategies that integrate environmental objectives into recruitment, training, performance management, and rewards systems.

Green Leadership. The presence of leaders who model, encourage, and reinforce environmentally responsible behaviors among employees.

Green Performance Management. The evaluation of employee performance based on environmental goals like waste reduction, energy efficiency, and resource conservation.

Green Recruitment and Selection. Hiring practices that prioritize candidates with environmental awareness, sustainability values, or green competencies.

Green Training and Development. Programs aimed at building employee skills, knowledge, and awareness to adopt environmentally sustainable practices.

Industry Type. The business sector in which the organization operates, influencing the specific Green HRM practices required.

Organizational Structure. The design of roles, responsibilities, and reporting lines that facilitate the implementation of Green HRM initiatives.

Personnel. Employees, managers, and HR staff who provide information on the application and effectiveness of Green HRM practices.

Sex. The category of employees, which may relate to differences in engagement with environmental programs.

Sustainability Culture. The collective values, norms, and behaviors that promote consistent participation in green HRM activities.

Work Experience. The total years an employee has worked, affecting their readiness to adopt and support Green HRM practices.

Years in Operation. The number of years the organization has been active, which may correlate with maturity in implementing Green HRM systems

CHAPTER 2

METHODOLOGY

This chapter will present the methodology of the study, describing the procedures and approaches that will be used to accomplish the study. It will discuss the research design that will guide the overall structure of the study, the research materials and methods that will be used for data collection, the research environment where the study will be conducted, the population and sample from which respondents will be selected, the research data and analysis plan that will be used for processing and interpreting the gathered information, and the research ethical standards that will be observed to ensure the integrity and credibility of the study.

2.1 Research Design

A survey questionnaire will be the main tool for gathering data. Identify findings statistically and establish whether a relationship exists between the independent variable (Demographic Profile and Company Characteristics) and the dependent variable (Green HRM practices). This study will be employed a quantitative, descriptive-correlational research design. The descriptive e component will assess and describe if there is current implementation of Green Human Resource Management (GHRM) practices in selected establishments, while the correlational component to determine the relationships between personnel's demographics, company characteristics, and the level of GHRM adoption. This design allows for the identification of patterns, trends, and significant associations among variables.

2.2 Research Locale

This study will be conducted in the municipalities of Buenavista, Nasipit, and Carmen in Agusan del Norte. These areas will be selected because they will contain a diverse establishment from an academic institution, a beach resort, an energy sector company, a water provider, and a recreational facility. While the selection will also consider accessibility for the researchers, the

main purpose will be to gather data from locations that offer a variety of workplace environments within the province. This will help ensure that the assessment of Green Human Resource Management (GHRM) practices will be based on a balance and realistic local representation.

2.3 Research Respondents

Table 1. Distribution of the Respondents

Respondents	Population	Sample	
	F	f	%
Buenavista			
Company A	15	7	3.2
Company B	15	7	3.2
Company C	55	24	11.1
Company D	10	4	1.8
Company E	12	5	2.3
Nasipit			
Company F	80	35	16.1
Company G	59	26	12.0
Company H	181	79	36.4
Carmen			
Company I	68	30	13. 8
Total and Corresponding Values:	**495** **217**	**217**	**100.0**

The data above shows the distribution of the respondents according to the HR head and personnel from selected diverse establishments in the local setting with organizational needs and environmental responsibilities that represent different industries and ownership types in BueNasCar.

To ensure representative data, a stratified sampling method will be employed to select respondents based on their roles and experience within the organization. Only personnel with at least 2-3 years of experience will be included, as those recently hired may not had sufficient exposure to provide accurate responses regarding the implementation of Green Human Resource Management practices. Structured survey questionnaires will be administered in person, with group sessions to be schedule for available respondents and individual sessions to be arrange for

those with busy schedules. This approach will ensure flexibility while maintaining the accuracy, confidentiality, and privacy of responses.

2.4 Research Instrument

The survey questionnaire that will be used in this study will be adapted and modified from existing validated studies to measure variables related to Green Human Resource Management (GHRM) practices. To ensure that the instrument will be accurate, reliable, and suitable for the local setting, several steps will be followed. First, the questionnaire will be submitted to subject matter experts, including the research adviser and panelists, for content validation. They will review each item to ensure that the questions are clear, relevant, and appropriate. Any suggestions or revisions from the experts will be incorporated to improve the clarity and applicability of the instrument.

Next, a pilot testing will be conducted with a small group of respondents who share similar characteristics with the target population. This will help identify any questions that may be difficult to understand or will be misinterpreted. Feedback from the pilot test will be used to make further adjustments, ensuring that the final questionnaire will be easy to answer and will accurately measure the intended variables. The pre-testing will allow the researchers to assess the reliability of the instrument, such as internal consistency, and make any necessary refinements. By following these steps, the study will ensure that the survey questionnaire will provide accurate, valid, and reliable for the assessment of GHRM practices among selected establishment.

The primary sources for the development of this instrument include Tang et al., (2017) – "Green Human Resource Management Practices: Scale Development and Validity," which provides for variables such as green recruitment and selection, green training and development, green performance management, and green compensation and awards. Paille et al., (2013) – "The

Impact of Human Resource Management on Environmental Performance: An Employee-Level Study," which examines employee-level perceptions of sustainability initiatives. Jabbour, (2011) – "How Green Are HRM Practices, Organizational Culture, Learning and Teamwork?" focusing on on the implementation of environmental practices within organizations. Laia and Palupiningtyas et al., (2025) - "Enhancing Environmental Performance through Green HRM and Employee Green Behavior: Evidence from Hospitality Industry –analyze the impact of GHRM on Environmental Performance, with Employee Green Behavior acting as a mediating variable within the hospitality industry in Semarang.

To ensure reliability and accuracy in data collection, it will employs a 4-point Likert scale to measure respondents' level of agreement, ranging from 'Strongly Agree' to 'Strongly Disagree, where 4 = Strongly Agree, 3 = Agree, 2 = Disagree, and 1 = Strongly Disagree

The survey questionnaire composes of four parts:

Part I. Gather data about description of respondent's profile.

Part II. Assessment of GHRM Practices among selected establishments.

Part III. Green Recruitment and Selection and Green Training and Development

Part IV. Green Performance Management, and Green Compensation & Rewards.

2.5 Ethical Standards

A. Intellectual Property Rights (IPR)

The researcher will ensure that all literature source, theories, and frameworks used in the study are properly cited following APA format. The survey questionnaire designed for this study will be considered the researcher's intellectual property, but it will only be used for academic purposes. No patented technologies, logos, or trademarks will be used beyond their descriptive function (naming the companies included in the study).

B. Informed Consent

Respondents, who are HR head and personnel of any job categories, were given a comprehensive explanation of the research's statement of the problem, methodologies, potential risks, and expected benefits before agreeing to participate. A consent form written in accessible language was provided to ensure that respondents were fully aware of their rights, including the freedom to withdraw at any stage without any negative consequences.

C. Data Privacy and Confidentiality

The study strictly will follow the Data Privacy Act of 2012 (RA 10173) in the Philippines. Will collect only the data needed for research purposes (such as demographic profile, company characteristics, assessment of GHRM Practices). Names or personal identifiers will not be recorded. Responses will be coded and anonymize before analysis. Data will be stored in a protected file and will only be accessible to the researcher and the research adviser. No third party will have access unless explicit written permission is given by the respondents in compliance with ethical and legal standards. For Data Disposal Procedure, upon completion of the study and publication of results, all collected data will be securely deleted from electronic storage. Any printed materials, such as survey forms or notes, will be shredded. Digital files will be removed from all storage devices and cloud platforms, ensuring they are irrecoverable. This procedure ensures that all respondents information remains confidential and is permanently disposed of in accordance with ethical research standards.

D. Voluntary Participation

Participation in the survey is entirely voluntary. Employees will be informed that they have the right to refuse or withdraw from the study at any time without any negative consequences. No tokens, incentives, or certifications will be provided, as the survey is conducted solely for academic purposes. This ensures that respondents do not feel pressured by their company management or the researcher and clearly understand the purpose of the study.

E. Minimization of Harm

The study involves HR heads and personnel from an academic institution, a beach resort, an energy sector company, a water provider, and a recreational facility in the municipalities of Buenavista, Nasipit, and Carmen in Agusan del Norte, who will be answering a survey questionnaire that does not pose physical, emotional, or psychological harm. Respondents will be given enough time to answer in a comfortable environment, reducing any stress or pressure. If any respondent feels uncomfortable with any question, they may skip it or stop participating altogether.

F. Beneficence

The findings of this research will help establishments assess whether they have implemented Green HRM (GHRM) practices, providing insights into areas where they can improve to achieve long-term sustainability. By identifying current practices and gaps, may enhance employee engagement, promote eco-friendly initiatives, and reduce the environmental impact of their operations.

This study will also serve as a valuable resource for HR students, helping them understand real-world applications of sustainable human resource management and the challenges organizations face in implementing green practices. Furthermore, the results may benefit the Department of Business Administration by contributing to academic research, supporting curriculum development, and informing future studies in sustainability and organizational management.

Findings may be shared with respondents or company management upon request, ensuring transparency and potential practical application

G. Justice and Fair Participant Selection

Respondents will be chosen from selected BueNasCar's establishments, including Beach

Resorts, Recreational Facilities, Energy Sector, a Water Provider, and Academic Institution. Only HR personnel and employees who are directly involved in organizational operations and HR-related activities will be included, as they are best positioned to provide insights into the implementation of Green Human Resource Management (GHRM) practices. A stratified sampling technique will be employed, dividing employees into strata based on the different establishments. This ensures fair representation from each establishment, minimizes bias, and allows for a more accurate assessment of GHRM practices across various organizational contexts.

H. Data Integrity and Accuracy

To ensure its accuracy, reliability, and suitability for the local setting, the questionnaire will first undergo content validation by subject matter experts, including the research adviser and panelists. Their feedback will be incorporated to improve clarity, relevance, and appropriateness. A pilot test, standardized statistical procedures will then be conducted with a small group resembling the target population to identify unclear or misinterpreted items. Feedback from this test will guide further revisions, ensuring the final questionnaire is understandable and effectively measures the intended variables then Simple Linear Regression Analysis, will be used to analyze the collected data.

Measures to maintain data integrity will include consistent coding of responses, checking for missing or inconsistent entries, and performing data cleaning prior to analysis.

Any limitations, potential sources of error, or biases in data collection and analysis will be acknowledged in the final report. These steps aim to ensure that the study's findings are valid, reliable, and capable of supporting credible conclusions regarding the implementation of GHRM practices in the selected establishments.

I. Transparency in Reporting

The results of the study will be presented truthfully and objectively, without any manipulation, exaggeration, or selective reporting of data. The researcher will ensure that all findings, whether they support or contradict the study's hypotheses, are accurately documented and interpreted based on the evidence collected. All references, theories, frameworks, and related studies used in the research will be properly cited following APA formatting guidelines. Any contributions, insights, or intellectual property from other researchers, institutions, or sources will be clearly acknowledged to maintain academic integrity and respect for intellectual property rights.

Additionally, the researcher will provide clear explanations of the methodology, data analysis procedures, and limitations of the study. Any assumptions made during the research process will be explicitly stated, ensuring that readers can understand how conclusions were drawn. By adhering to these practices, the study will uphold the principles of transparency, accountability, and ethical reporting, contributing to the credibility and trustworthiness of the research findings.

J. Use of Patented or Copyrighted Materials

The study will not utilize any patented technologies, proprietary tools, or inventions without proper authorization. Any copyrighted materials, including books, journal articles, research instruments, questionnaires, or other sources referenced in the study, will be properly cited in accordance with APA formatting guidelines. Where necessary, the researcher will seek permission from the copyright holders before reproducing or adapting any content for use in the study. This approach ensures that the research respects intellectual property rights, avoids infringement issues, and upholds the ethical standards of academic integrity.

By adhering to these practices, the study guarantees that all sources are appropriately credited and that the researcher maintains transparency and professionalism in handling external

materials.

K. Ethical Considerations for Human Respondents

The human respondents of this study will include employees and HR head and personnel from the selected establishments who will participate in assessing the implementation of Green Human Resource Management (GHRM) practices within their organizations. All respondents will be fully informed about the purpose of the research, the intended use of the data, and their rights as participants before data collection begins. Participation will be entirely voluntary, and respondents will have the right to withdraw at any point without any consequences.

The study will avoid sensitive, invasive, or highly personal questions and will involve no physical or psychological risks to participants. Measures will be implemented to ensure confidentiality and anonymity, including assigning unique codes to survey responses and securely storing all collected data. The information gathered will be used exclusively for academic research purposes, and only the researcher and authorized personnel will have access to any identifiable information. Ethical standards and principles in conducting research involving human participants will be strictly observed throughout the study.

L. Responsible Use of AI

AI tools, such as ChatGPT and Grammarly, will be used only to draft, refine, and improve the clarity of the research methodology and ethical considerations sections. The researcher will review and verify all AI-generated content to ensure that it will be accurate, original, and aligned with the objectives of the study. These measures will guarantee responsible and ethical use of AI technology, maintaining academic integrity and research quality.

M. Ethical Approval

Prior to data collection, the researcher will secure formal ethical approval from the Saint Michael College of Caraga's Ethical Review Board. Permission letters and approval have been

obtained from the management of all participating establishments such as the management of Beach Resorts, Recreational Facilities, Energy Sector company, a Water Provider, and Academic Institution at Buenavista, Nasipit, and Carmen in Agusan del Norte. To ensure compliance with institutional requirements. These actions will guarantee that the study will adhere to ethical protocols for protecting human respondents and ensuring institutional oversight. By obtaining these approvals, the research will demonstrate commitment to ethical standards, participant safety, and accountability in conducting scholarly research.

2.6 Data Gathering Procedure

With the adviser and dean approval, the researchers requested signed permission and approval letters that will be given to selected establishments within BueNasCar to gather information on their total population to allocate sample size**.**

Letter of Approval: Prior to data collection, formal permission letters will be secured from the management of Beach Resorts, Recreational Facilities, Energy Sector company, a Water Provider, and Academic Institution. Ethical approval will be obtained from the Saint Michael College of Caraga's Ethical Review Board. These steps ensure compliance with institutional policies and ethical research standards.

Orientation: Respondents will undergo orientation regarding the study's purpose, procedures, and ethical considerations. This session will provide respondents with clear information to help them understand their rights, the voluntary nature of participation, and how their data will be used.

Distribution of Informed Consent: Respondents will be provided with consent forms explaining the statement of the problem of the study, measures to ensure confidentiality, and their right to withdraw at any time without consequences. Only respondents who will provide consent will complete the survey, ensuring voluntary participation.

Sampling: Respondents will be selected using stratified sampling based on strata, focusing on HR Head and personnel to guarantee fair and representative participation across different employee groups. This approach will allow the study to capture diverse perspectives and ensure that findings reflect the organizational structure and workforce composition of each selected establishment.

Distribution of Questionnaire and Retrieval: Questionnaires will be distributed to the selected respondents and later will be retrieved for review. All completed questionnaires will be checked for completeness and accuracy, and follow-up clarification will be conducted if necessary to ensure data quality.

Data Handling and Analysis: Collected data will be encoded, tabulated, and analyzed using appropriate statistical techniques, such as Simple Linear Regression Analysis, to determine the presence, extent, and impact of Green Human Resource Management (GHRM) practices within the participating establishments. Data will be stored in a protected file and will only be accessible to the researcher and the research adviser. No third party will have access unless explicit written permission is given by the respondents in compliance with ethical and legal standards.

Decomposition and Privacy: For data disposal, upon completion of the study and publication of results, all collected data will be securely deleted from electronic storage. Any printed materials, such as survey forms or notes, will be shredded. Digital files will be removed from all storage devices and cloud platforms, ensuring they are irrecoverable. This procedure ensures that all respondents information remains confidential and is permanently disposed of in accordance with ethical research standards.

To protect the privacy of respondents, any personally identifiable information will be collected separately from survey responses and will be replaced with unique codes. Survey responses will be stored in an anonymized dataset that will not reveal individual identities. Demographic

information will be grouped into broader categories to further prevent identification. All data analysis will be performed using aggregated information only, while the original personal information will be securely stored in access-controlled systems available exclusively to authorized researchers.

Ethics: Participation will be voluntary, and respondents will have the right to withdraw at any stage. Confidentiality and anonymity will be ensured, and all collected data will be used solely for academic and research purposes. These measures will uphold ethical standards and protect the rights and welfare of all respondents throughout the study.

2.7 Data Analysis Plan and Procedure

The study "Assessment of Green Human Resource Management Practices among Selected Establishments" will use stratified sampling, a method in which respondents are divided into strata based on their demographic profile and company characteristic, to ensure fair and adequate representation of HR heads and personnel from each selected establishment.

Statistical Treatment

The data collected from the survey questionnaires will be analyzed using appropriate statistical tools to assess the implementation of Green Human Resource Management practices in the selected establishments within the Municipalities of Buenavista, Nasipit, and Carmen, Agusan del Norte.

Percentage and frequency distribution will be used to summarize the demographic profile of the respondents and the characteristics of their companies, including an assessment of whether their establishments have implemented or will implement GHRM practices. This will provide a clear understanding of the composition of the respondents.

Weighted mean Weighted mean will be applied to determine the extent to which GHRM practices are implemented in the selected establishments. Each survey item will be assigned a

numerical value based on the respondents' ratings, and the weighted mean will be computed to provide an overall measure of the adoption level of various GHRM practices. This method allows the researcher to quantify subjective responses into a standardized score, facilitating comparisons across different establishments and practice areas.

Additionally, the weighted mean will help identify which specific GHRM practices such Green Recruitment & Selection, Green Training & Development, Green Performance Management, Green Compensation & Rewards are more widely adopted, and which may need further organizational focus or improvement. The results will provide a comprehensive overview of the current implementation status of GHRM practices, offering actionable insights for management and stakeholders seeking to enhance sustainable human resource initiatives

Pearson Product-Moment Correlation (r) will be used to determine the relationship between specific GHRM practices such Green Recruitment & Selection, Green Training & Development, Green Performance Management, Green Compensation & Rewards and the assessment of GHRM practice implementation. The correlation coefficient will reveal the strength and direction of these relationships, helping the study determine whether the presence or level of certain practices is associated with broader GHRM adoption.

All analyses will be conducted using appropriate statistical software to ensure the accuracy, reliability, and validity of the findings. The results will be interpreted to assess the degree of GHRM practice implementation and the relationships among various practices within the selected establishments. This approach will offer insights into which specific green HR initiatives contribute to overall organizational sustainability and will inform recommendations for enhancing the effectiveness and integration of GHRM practices."

.
