CHAPTER 1

THE PROBLEM AND ITS SCOPE

1.1 Background of the study

Stress is a regular part of life, often triggered by responsibilities that require us to adapt in different areas, such as at home, school, or work. Teaching is widely seen as one of the most stressful jobs because teachers deal with pressures from their personal lives, society, administrative tasks, and teaching duties. As cited by Paril, (2023)teaching profession has the highest stress levels, which contributes to a comparatively high 8% annual teacher turnover rate. Burnout and mental health issues are frequently caused by the demanding nature of the job.

Globally, teachers are essential for students' learning and growth. However, according to G & Shwetha, (2025) many instructors experience stress, which can affect their health and work productivity. According to studies, teachers experience anxiety, exhaustion, and reduced job satisfaction due to the extensive workload and high expectations they face (Magtalas, 2024a; Nwoko et al., 2025) Higher stress levels, burnout, and poorer job performance are associated with these factors Hascher & Waber, (2021). Teachers can stay engaged and preserve their mental health with the assistance of schools, which includes trust, healthy work conditions, and effective leadership (Salvo-Garrido et al., 2025). Both emphasize that problematic student behavior, a heavy workload, and a lack of support are significant causes of teacher stress and burnout (Carroll et al., 2022; Suttles, 2024). It also points out that too many administrative tasks and insufficient preparation time are familiar sources of stress for teachers. According to Ferguson et al.,

(2022) teachers are often said to carry a heavy emotional burden as they must teach academic content and manage students' emotions. Burnout, emotional weariness, and a diminished capacity to provide for pupils might result from this strain (Agyapong et al., 2022). As cited by Ghasemi et al., (2023) strategies that support teachers in maintaining their health while performing their duties are necessary. Although stress can at times be useful, it is harmful primarily when educators lack effective coping mechanisms. Coping skills can make the difference between burnout and resilience. Also, Cervellione et al., (2025) found that building confidence, learning emotional skills, and practicing mindfulness can lower teacher burnout, boost resilience, and help keep classrooms welcoming (Pogere et al., 2019). Teachers who use problem-focused coping and have support for autonomy feel less emotionally drained, while those who rely on emotion-focused coping and have too much work are more likely to burn out (Chang et al., 2022)

In the Philippines, teacher stress often comes from heavy workloads, limited support, and difficult classroom situations. According to Magtalas, (2024) high class sizes, paperwork, low pay, limited administrative support, and misbehavior by students are the primary causes. In addition, a lack of resources, packed classrooms, and administrative responsibilities are all issues that negatively impact teachers' well-being, according to (Alson, 2019). Large class sizes frequently force teachers to bring work home (Ancho & Bongco, 2019). Ma. Dencel D. Ausa, (2023) emphasizes the difficulties Gen-X teachers encounter when utilizing technology and implementing ongoing programs, emphasizing the value of professional development to facilitate the shift and lessen burnout. According to De la Cruz & Macalisang, (2024) emotional exhaustion is a powerful indicator of job

unhappiness that can lower motivation, engagement, and retention. Although Filipino teachers use both emotion-focused strategies and problem-focused strategies, there are still gaps in the research. Most studies in the Philippines are cross-sectional and descriptive, so few examine the long-term effects of stress and coping. Younger teachers report more stress and use more problem-solving and religious coping than older teachers (Lagos, MSLT & Magallanes, 2020). However, age differences are rarely studied, making it hard to design targeted interventions. Filling these gaps is essential for creating age-appropriate, context-based programs that help teachers become more resilient and improve their well-being.

This study aims to identify the stressors and coping mechanisms of in-service teachers at Nasipit Central Schools, Nasipit, Agusan del Norte, as a basis for developing an intervention program. It will identify the main stressors teachers face at work, including increased workloads, job pressure, work environment, relationships with others, and technology demands. The research aims to help schools support teacher resilience, encourage healthy coping, and improve mental health and work-life balance. The goal is to increase teachers' motivation and effectiveness and raise the quality of education for students through an intervention program.

The findings can help teachers understand what causes their stress and become more aware of their relationships with school leaders, parents, and students. School administrators can use these results to build stronger support systems, such as training and wellness programs, so teachers feel better prepared and more appreciated. When teachers are healthier and more resilient, they can teach more effectively and foster a

positive classroom atmosphere. Students may also see what teachers experience, which could lead to better cooperation. For parents and the community, the results can draw attention to the difficulties faced by educators and generate additional support. Lastly, this research could be a useful resource for future researchers who want to learn more about teacher well-being and create programs that support the teaching profession.

1.2 REVIEW OF RELATED LITERATURE

This section presents a comprehensive and critical review of the existing literature on the stressors encountered by in-service teachers and the coping strategies they use to manage these challenges.

It is widely recognized that teaching is one of the most demanding professions, often associated with elevated stress levels that affect both the mental health of educators and classroom conditions. Stress can be a normal response to tasks beyond someone's capacity; however, when it becomes excessive, it may lead to worse outcomes, such as job dissatisfaction and impaired daily functioning (Emeljanovas et al., 2023). Several studies highlight different stressors affecting educators in the teaching field, including (Cavallari et al., 2024; Wettstein et al., 2021) who reported that teachers often experience high levels of stress due to heavy workloads, extracurricular responsibilities, and professional development. Not only that, Longobardi et al., (2021) also included stressors, such as challenging work relationships and conflicts between their professional and personal lives. Nappo, (2020) highlighted that relationship with colleagues correlates with level of stress, school environment contributes a significant stress for educators Mugat, (2025) and gender, years of service, age, and work status are also be a factor for stress (Muhamad et al., 2023). These stressors can harm teachers' well-being including impact on the productivity, well-being, and health of teachers which could eventually lead them to develop burnout (Agyapong et al., 2022). In this literature review, various stressors, gathered from the findings of different research studies, affecting educators are being

discussed such as increased workload, job demands, physical environment, technological demands, and demographic factors.

Stressor

Stress is a psychological tension often in response to encountered difficult situations. It is a natural psychological response of the human body that allows individuals to adapt to and respond to specific pressures. Generally, stress is everyday and thus, effective management is necessary for overall well-being. Stressors that disturb homeostasis, whether physical or psychological, influence the stress response. The neurological, endocrine, and immune systems interact to stimulate the sympathetic-adrenal-medullary (SAM) axis, the hypothalamic-pituitary-adrenal (HPA) axis, and the immune system in response (Chu Brianna, 2025).

Several studies have explored how stress specifically manifests in high-pressure occupations like teaching, building on the idea that stress comes from a variety of factors. In addition, stress manifests as a response to potential stressors that can trigger it. When stress is not controlled correctly, people find it challenging to communicate with others, both at work and outside of it (Wahab et al., 2024). Similarly, Emeljanovas et al., (2023) emphasized that teaching is a highly demanding, stressful, and anxious profession that can result in mental illness, poor well-being, and work dissatisfaction. According to these results, people are more likely to use coping strategies to manage their reactions and effects when they encounter stressors. A cognitive, emotional, and behavioral strategy for handling internal and external pressures is called coping (Pagulong & Bulilawa, 2021) According to the same study, good stress management can affect the amount of stress felt.

The results made clear that various people may react to the same stressor with different levels of stress. In line with this, Agyapong et al., (2022) also emphasize that the stress associated with being a teacher can be connected to three main overlapping problems: depression, anxiety, and burnout. Among the many effects of these issues are those on the health, happiness, and productivity of teachers. These findings support the idea that coping strategies play a crucial part in influencing an individual's stress response. According to Pagulong & Bulilawa, (2021) examining coping mechanisms, job stressors, and work efficiency, the results showed that job stress can significantly impact productivity. A high frequency of work-related stressors is associated with lower productivity because workers may perform worse when exposed to them.

In the context of education, according to Wettstein et al., (2021) teaching is a very stressful job that has an impact on student outcomes, the economy, and health. School administrators may reduce teachers' stress by creating supportive work environments, according to a study by (Pagulong & Bulilawa, 2021). In a study on anxiety and depression in elementary and high school teachers, Pagán-Garbín et al., (2024) discovered that teachers with less than five years of experience were more likely to suffer anxiety than those with more than twenty years. Their study found that teaching experience was a greater indicator of psychological distress than age. Generalized anxiety disorder (GAD), which was primarily caused by unfamiliarity with workload, lack of routine, and lack of coping mechanisms, was 3.6 times more common in young teachers. M. Cabaguing, (2022) found that public elementary teachers often feel stressed due to poor working conditions, work overload, and student misbehavior. These problems increase stress and make it more

difficult for teachers to perform their jobs effectively. In another study, Skaalvik et al., (2018) found that increased job demands are a key source of stress for teachers. Teachers often feel stressed because they handle many tasks, work under a heavy workload, and face constant time pressure.

Poor Working Environment

According to M. Cabaguing, (2022) poor work environment is a common source of stress for teachers. This includes their workplace's non-physical, psychological, and physical aspects. Teachers are more driven and more capable of carrying out their responsibilities when they work in a positive environment, which is mostly achieved through encouraging connections and fair management. Wong, (2020) described teachers' work environment as the physical setting of the school in which they perform their duties. This encompasses factors such as classroom and staff room sizes, availability of a rest area, campus tidiness, school facilities, and the air quality of the enclosed area. Teachers' comfort, productivity, and general well-being are greatly influenced by their physical surroundings. According to Alson, (2019) teachers frequently experience stress as a result of unsafe work situations and a lack of resources or instructional materials for effective teaching. Teachers are also subject to more administrative oversight and have stricter performance standards. Similarly, Maffea, (2020) noted that it can be difficult to manage classes of 20 to 30 students every day. Teachers must effectively teach classes, meet the requirements of a varied student needs, and make do with limited resources. Teachers may become less motivated and enthusiastic about their work because of these persistent difficulties and a lack of resources. Supporting this, Mugat, (2025) study found that

excessive heat in the school environment was a major contributor to physical environmental stress among instructors, highlighting the importance of maintaining conducive, comfortable working conditions for educators. Stress poses a significant challenge for educators, particularly in the Philippines, where issues arise not only from students whose family circumstances greatly influence their learning but also from various conditions within the school environment (Mugat, 2025). The number of students in Philippine public schools is quite high.

As a result, educators often find themselves grading and reviewing assignments at home since they lack sufficient time to complete these tasks during school hours (Ancho & Bongco, 2019). In the study by Mugat, (2025) findings showed that teachers' stressors across all domains indicated that the school's physical conditions had the most significant impact, with a high level of stress reported. He further elaborated that excessive heat was the primary factor contributing to stress related to the teachers' physical environment. Additionally, a poor work environment has also been linked to higher levels of anxiety and depression symptoms, as reported by (Peele & Wolf, 2020). Agyapong et al., (2022) emphasize that as teachers' working hours inevitably increase, their responsibilities also do, which will raise job demand and eventually result in stress that will lead to anxiety and depression.

Moreover, the non-physical or social aspects of the work environment also contribute to teachers' stress. Nappo, (2020) noted that workers who maintain positive relationships with their co-workers are generally successful and productive at work, even when job stress is high. He also added that maintaining cooperation and having good

relationships with co-workers reduces the likelihood of feeling stressed. Conversely, teachers who have difficulty communicating with students' parents and hold unresolved disputes with co-workers are more likely to experience burnout (Tikkanen et al., 2022). Also Vermote et al., (2022) found that teachers who felt greater social pressure from students or colleagues were less satisfied and more frustrated with their work.

Work Overload

M. Cabaguing, (2022) states that teachers suffer from work overload as a result of the amount of time they spend working, the frequent changes in their responsibilities, and the demands of a changing curriculum. These factors greatly increase their stress levels, which has an impact on their general well-being and performance as teachers. To promote learning and improve educational experiences, teachers are essential. According to Tarraya, (2023) study, teachers' personal lives, professional performance, mental and physical health, and even student outcomes were all negatively affected by their heavy workloads. Teachers are unable to perform their primary teaching duties effectively due to additional challenges arising from heavy workloads. In the study of Osorio Vanegas et al., (2025) it was highlighted that "teachers must be trained in 21st-century skills and in the effective use of digital technologies to transform teaching and learning"; thus, training is necessary for professional development while equipping teachers with the innovations practical in the dynamic education system. In the same study Osorio Vanegas et al., (2025) as noted by Max et al., (2022) many educators often encounter pressures due to heavy workloads, asynchronous teaching, and challenges in managing information. These

findings underscore the importance of workload management and the need to address the complexities of teaching.

The quality of teachers, who are defined by their good mental well-being, determines the quality of learning in the educational process. As a result, it is crucial to consider the factors that influence teachers' well-being (Yudhistira et al., 2025). However, teachers are often reported to experience high levels of stress due to heavy workloads, including creating lesson plans, grading, extracurricular responsibilities, and professional development. Excessive perceived stress negatively impacts teachers' well-being and the quality of education they deliver (Cavallari et al., 2024; Wettstein et al., 2021). Filipino teachers in the Philippines face significant levels of workplace stress, with the majority identifying heavy workload as their primary stressor Mugat, (2025).

As the curriculum changes annually or varies by educational level, teachers are under pressure to meet specific academic standards. Educators must revise their previous teaching strategies and content to meet national policy requirements, which undoubtedly increases their workload. They also face pressure from the institution to have their teaching effectiveness evaluated and their performance assessed (Zhao et al., 2022). Teachers also often feel pressed for time between creating lesson plans and grading tests (Soria, 2022). High academic demands have been associated with higher perceived stress, reduced engagement, and increased dropout intentions among teacher education students (Hahn et al., 2025). Wahab et al., (2024) stated that educators are certainly overloaded and burdened with various obligations, including both teaching-related and non-teaching responsibilities. The workload for most teachers is rising, with non-teaching

tasks becoming more prevalent than in the past, and they are occasionally assigned duties they are not accustomed to handling. Consequently, many teachers feel forced to take some of their challenging assignments home to finish. Even though a teacher's primary duty is to educate, they are also required to serve on committees and submit numerous reports and forms to school administrators (Krishnan, 2022).

Longobardi et al., (2021) added that educators feel stressed in their profession when they struggle to cope with various stressors, such as challenging work relationships, feeling undervalued in their roles, time constraints, excessive workloads, a lack of autonomy in their tasks, conflicts between their professional and personal lives, inadequate compensation, and insufficient benefits. Educators face significant stress in aligning with curriculum requirements, preparing learners for standardized assessments, and addressing each student's needs (Qin, 2024). According to the Job Demands-Resources Theory Camacho et al., (2021) an imbalance between demands and resources can lead to stress and burnout. The expectation that teachers should "do it all" without sufficient support or resources imposes an additional emotional burden, frequently resulting in feelings of inadequacy, frustration, and helplessness when they cannot meet every demand. Moreover, teachers are recognized for managing students in a classroom, which involves addressing varying student behavior, attention, and even emotions. With that, a diverse environment adds to the stress teachers must cope with. Thus, it is impossible to focus on a specific student, and it even causes limits on teachers' capacity to focus on their own psychological state (Blessing, 2024).

Student Misbehavior

There is a correlation between the rise in student misbehavior and the increase in personal and professional stress among teachers (Will, 2023). One of the main causes of stress for teachers is thought to be issues with student behavior M. Cabaguing, (2022). Students' disruptive behaviors, like mischievousness and difficulties maintaining discipline, frequently overwhelm teachers. Similarly, Vidić et al., (2021) discovered a positive relationship between teacher burnout and student misbehavior, suggesting that the more misbehavior teachers deal with, the more likely they are to become emotionally exhausted.

The way teachers handle classroom behavior has a big impact on the entire learning environment, claim (Palma B., 2022). The use of inappropriate language, bullying, inattention, and violence are examples of common misbehavior. These behaviors have negative effects on student learning outcomes as well as on the effectiveness of teaching. According to Pelo et al., (2023), continuous disruptive behavior harms student-teacher relationships in addition to affecting academic performance, motivation, and focus.

Furthermore, Kollerová et al., (2023) emphasized that exposure to disruptive behavior on a regular basis is a major factor in teacher burnout and emotional exhaustion. Compared to teachers who do not deal with classroom misbehavior on a regular basis, those who do have higher stress levels and lower work satisfaction. However, the study also showed that supportive school leadership can lessen these negative effects and lessen the impact that student misbehavior takes on teachers' well-being.

Job Demands

According to Skaalvik et al., (2018) , job demands are a significant source of stress for teachers. The study found that job demands strongly predict lower levels of teacher well-being. The demanding nature of teaching often blurs the boundary between their professional and personal life. Blessing, (2024) also emphasized the challenges of the teaching profession, where many educators frequently extend schoolwork at home, such as grading assessments. This engagement exhibits compromised personal time and adversely affects their overall well-being. Teachers experience consistently high levels of stress due to the significant physical and mental energy required to manage classroom activities, instructional responsibilities, and students' needs. In addition to these professional demands, they also face additional pressures stemming from personal and familial obligations, further intensifying their overall stress levels (Emeljanovas et al., 2023; Khalifa M. et al., 2022) added that the evolving nature of work environments, the rapid pace of social change, the rise of digital technologies, and the responsibility of teaching children with special needs create greater expectations for educators. Moreover, the distribution of workload also contributed to increased teachers' stress levels. As noted by Kambli et al., (2025), teachers are often given additional responsibilities beyond their regular duties that must be completed under tight deadlines, further exacerbating their stress. Managing personal and professional responsibilities is a struggle for many educators; however, the online format of courses, combined with work-from-home guidelines and constant online work, blurs the physical, time-based, and mental boundaries between home and school.

Furthermore, numerous studies have shown that the conflict between family and work makes it difficult for people to manage the dual responsibilities of work and family, ultimately leading to job burnout (Ji & Yue, 2020). As a result, the challenges and obstacles faced can decrease job satisfaction and commitment, lead to stress and anxiety, and potentially result in depression or burnout. These issues are significant risk factors for deteriorating physical and mental health (Emeljanovas et al., 2023).

Coping Mechanism

Coping with stress is the process by which an individual manages stressful situations and the emotions they evoke, either through thought or behavior, using constantly changing techniques. As stated by Voitenko, (2021) inadequate adaptation to stress is associated with the absence of a flexible set of coping strategies suitable for specific situations and their contexts, as well as with the individual's capabilities. As highlighted by Wang et al., (2022) choosing suitable coping strategies is crucial, as they foster positive emotions, reduce burnout, and enhance teachers' mental health. Conversely, ineffective coping strategies can trigger negative feelings, elevate stress, and potentially harm individuals' mental well-being. Orlanda-Ventayen et al., (2021), as cited from Fernandez, (2023) presented the outcomes of their research on workplace stress and depression among educators. According to the findings, educators occasionally encounter stress at work, while some may deal with depression. It is suggested that educators should learn to manage stress and implement coping strategies to alleviate stress and depression.

A study conducted by Cruz, (2020) reported that as emotional stability increased, burnout decreased significantly. Pellerone et al., (2020) also found that teachers' ability to

regulate their emotions positively affects their well-being and relationships in the academe. Coping strategies are methods for dealing with challenges, specific behaviors individuals employ when facing difficult circumstances (Barnová et al., 2023).

Problem-focused coping is centered on tackling the underlying issue of the stressor, effectively seeking to resolve the problem (Carroll et al., 2022). In contrast, Emotion-Focused Coping emphasizes managing the emotional reactions to the stressor rather than addressing the stressor itself. Some people may resort to Avoidance-based Coping, in which they distance themselves, either physically or psychologically, from the stressor. In contrast, Approach-based Coping involves actively engaging with the stressor and striving to handle it directly (Maqsood et al., 2024). Olasehinde, (2025) identified three major coping strategies: problem-focused, emotion-focused, and avoidant.

Problem-focused Coping

Problem-focused coping involves deliberate efforts to recognize and directly address the source of stress. This approach emphasizes practical strategies to resolve the problem or modify the conditions that cause distress. These strategies are employed when a stressor is perceived as manageable or when additional information about the issue can be gathered to address it effectively. According to Olasehinde, (2025) this coping style is positively correlated with improved psychological well-being, particularly when the stressor is perceived as controllable.

Individuals employing problem-focused coping typically report reduced anxiety and depression levels, along with enhanced life satisfaction. This type of coping focuses

on taking direct action to alter either the external environment or one's internal responses, aiming to resolve the source of stress rather than merely alleviating its emotional impact. Aulén et al., (2021) Educators employ strategies that concentrate on the problem to address specific situations they perceive as challenging. They seek guidance or assistance from colleagues who have faced similar difficulties (Barnová et al., 2023). Moreover, this coping strategy fosters emotional resilience, enabling individuals to recover from stressful experiences more efficiently and adaptively.

Emotion-focused Coping

Emotion-focused coping, as described by Olasehinde, (2025) involves strategies designed to regulate or reduce the emotional impact of a stressor rather than addressing the stressor itself. Such strategies include seeking social support, using relaxation techniques, or engaging in activities that provide emotional comfort, such as prayer, journaling, or self-soothing behaviors. This form of coping proves particularly beneficial when the stressor is beyond one's control, in which case emotional regulation becomes a crucial means of psychological adaptation. According to Suttles, (2024) participants reported seeking support from their family and community, both within and outside the classroom. Every participant agreed that talking to and spending time with family members helps them relieve stress.

Baker et al., (2021) also discovered that enhancing protective factors (such as prioritizing personal health, engaging with family and friends, and building connections with supportive individuals) was associated with improved coping and resilience among teachers. Graves et al., (2021) supported the claim that women experience greater stress

levels and are more likely to utilize emotion-focused coping. They tend to employ strategies such as self-distraction, seeking emotional support, and expressing their feelings more frequently than men do in educational contexts. These trends, as reflected in the research conducted by Maqsood et al., (2024) provide a more nuanced understanding of gender-specific coping strategies during stressful situations.

Avoidant Coping

Olasehinde, (2025) further explained avoidant coping as behaviors and cognitive strategies aimed at disengaging from the stressor, often through avoidance, substance use, or distraction. This coping style includes both behavioral avoidances, such as withdrawing from social interactions, and cognitive avoidance, such as minimizing the significance of the stressor or using denial to cope with distress. According to William Joseph, (2025), emotional suppression is the attempt to suppress or disregard feelings, which over time may result in emotional dysregulation or numbness. Results from the study of Encarnacion, (2024) suggest that individuals experiencing higher levels of stress may rely more on coping strategies that involve diverting attention or ignoring stressors rather than actively addressing symptoms. This implies that teachers may employ avoidant coping strategies, which may not actually reduce their stress. Individuals who utilize avoidant coping typically suffer from long-term stress and mental health issues, according to several studies. Escaping is an ineffective coping mechanism that occurs when an educator abandons their role, such as by resigning from teaching, suggesting a reliance on escape. Marais-Opperman et al., (2021) view this as the last stage in the decision-making process

associated with job transitions. Avoidance coping can make negative emotions worse by keeping people from facing the stressor and dealing with their feelings. As unresolved emotional problems mount up over time, this can result in increased psychological distress.

These coping strategies make a significant contribution to psychological well-being by managing stress and emotional distress. In a study, results revealed that teachers who use a few different coping strategies within a specific coping category may have an explicit self-concept, allowing them to know which coping strategy best helps them in a particular kind of stressful situation (Aulén et al., 2021). In his study, William Joseph, (2025) indicates that individuals with high levels of emotional intelligence are more likely to use flexible coping strategies. Therefore, it is pivotal to develop effective coping strategies aligned with specific stressors. Interventions that promote problem-solving skills, emotional regulation, and resilience can help people manage stress more effectively, improving their overall mental health.

Chronic exposure to stress impairs well-being and productivity, even while it can foster adaptability. Accordingly, coping strategies are essential for shaping how teachers respond to both internal and external stressors, which, in turn, affects their psychological fortitude and productivity at work (Pagulong & Bulilawa, 2021). According to Mugat, (2025) teachers actively cultivate coping mechanisms as part of their adjustment process, which gradually shifts as they gain experience and become accustomed to the demands of their jobs. Coping strategies are vital in managing these stresses, as problem-focused

and emotion-focused coping promote psychological well-being and resilience, whereas avoidant coping often has long-term negative consequences.

According to the literature review, novice teachers and those with less than 5 years of experience have the highest levels of stress, while the most experienced teachers face the most significant risk of burnout. However, certain factors can mitigate adverse outcomes, with resilience being a key determinant of success or failure (Barnová et al., 2023). Furthermore, as teachers constantly encounter new situations, their coping strategies expand throughout their teaching journey, enhancing their ability to withstand stress and confront challenges with minimal harm.

The effectiveness of coping mechanisms depends on various factors, including personality traits, the nature of the stressor, and available resources (William Joseph, 2025). Thus, maintaining teacher effectiveness and well-being requires creating supportive settings and implementing organized intervention programs (Olasehinde, 2025). Scheduled meetings and feedback discussions should be held to address any difficulties or concerns instructors encounter, facilitating proactive solutions and enhancements (Qin, 2024). Ghasemi et al., (2023) Recommended additional studies to explore teachers' coping strategies in response to adverse events and identify factors that influence specific methods, to develop targeted programs that foster effective coping strategies.

Demographic Factors

There are many forms of work stress experienced by teachers, including internal, external, and even demographic factors. These factors not only reflect the distinctive

characteristics of teachers but also clearly demonstrate how organizational and social contexts shape experiences of stress. Specifically, gender, years of service, age, and work status are examples of demographic factors (Muhamad et al., 2023).

Gender

The level of stress differs between male and female teachers. Previous studies have reported that demographic variables, such as gender, may affect the levels of occupational stress experienced by teachers (Muhamad et al., 2023). Just as gender influences stress experience, male and female teachers also differ in the coping strategies they adopt when faced with stressful situations, suggesting that men and women use different coping strategies to manage stress (Loziak, 2021). In Raj, (2024) study, a survey found that over 60% of female teachers reported moderate to high levels of stress, compared to 50% of male teachers, suggesting that female teachers experience somewhat higher stress levels than their male colleagues. The additional social and familial responsibilities that female teachers frequently carry out help to explain the difference. Stress levels can rise because many female instructors manage heavy household and childcare obligations alongside their job responsibilities. Women who work frequently often face additional responsibilities at home, and juggling both roles can elevate their stress levels compared to men, who may experience fewer home obligations (Agyapong et al., 2022). Perera et al., (2019) also reported that male teachers' self-efficacy was lower than that of female teachers.

The identified disparities in male and female teachers' well-being components highlight the importance of accounting for gender-specific characteristics when designing support and interventions for wellness systems. The effects of gender differences on teachers' job satisfaction must be taken into consideration, as this area has not yet been fully explored. As reported by some studies, female educators have higher rates of depression compared to male educators (Capone et al., 2019; Othman et al., 2019). Addressing the factors that influence teacher well-being is crucial to reducing stress, burnout, and attrition among educators. Recognizing the relationship between the educational environment and teachers' demographics is essential for creating targeted interventions to enhance teachers' well-being across different demographics (Nwoko et al., 2025). Likewise, interventions that focus on gender and sex disparities may be viewed as beneficial for promoting the mental well-being and work efficiency of female educators (Agyapong et al., 2022).

Age

According to Nwoko et al., (2025), teachers exhibit a range of individual characteristics that may affect their well-being at work, including age, gender, experience, and educational background. In the study of Noor Ismail et al., (2019) teachers in the 30–39 demographic report higher levels of stress than those in the 40–49 age range. Age-related differences exist in stress levels (Vercambre et al., 2022). According to Raj, (2024) study, younger teachers particularly those with fewer than 5 years of classroom experience report significantly higher stress levels than their more experienced colleagues. For instance, just 45% of educators over 40 reported significant levels of stress,

whereas almost 65% of educators under 30 did. According to (Nwoko et al., 2025), experienced teachers may find it challenging to maintain their enthusiasm and adjust to modern teaching methods, while younger educators may struggle with work-life balance and unstable employment. The main finding of Alghamdi & Sideridis, (2025) study was that older, although more experienced, teachers exhibited higher levels of burnout, whereas younger teachers showed the opposite pattern. The high burnout levels in older teachers may be explained by the rapid technological advances and educational practices that move beyond traditional teacher-centered models.

Length of Service

A teacher's experience of stress and coping mechanisms can be greatly influenced by the length of time they have been in the field. This factor is also closely linked to age. Research indicates that novice teachers, typically those with less than five years of experience, are more likely to experience anxiety and stress (Pagán-Garbín et al., 2024; Ptáček et al., 2019). Alghamdi & Sideridis, (2025) found that the more experienced teachers are, the higher their levels of burnout are, whereas teachers with less than 5 years in the field exhibit lower levels of burnout than the former.

Civil Status

Long workdays, tight deadlines, and a lack of family time due to work obligations can all negatively impact a marriage, particularly the level of happiness of one partner (Commey-Mintah et al., 2023). Consequently, a job responsibility may affect marital satisfaction in this manner. Considering educators' experiences and the difficulties they

face with distress coping mechanisms and job performance requires accounting for their civil status (Encarnacion, 2024). He further explains, for example, that married educators may have different pressures and support requirements than their single colleagues, especially when balancing work and home responsibilities. Likewise, teachers who have lost a spouse might need specific types of support to manage the emotional effects of grief while continuing to perform their professional roles.

Moreover, Fan & Fang, (2025) demonstrated that marital status and gender significantly affect teachers' stress in rural areas. This could be explained by the fact that female educators frequently face conflicting demands from family and work obligations, which are compounded in rural areas by limited resources and social assistance.

Theoretical Framework

This study on teachers' stressors and coping mechanisms serves as the foundation of Richard Lazarus' Transactional Theory of Stress and Coping (1997) and Ingrid Cordon's Biopsychosocial Model of Stress (1997).

Transactional Theory of Stress and Coping by Lazarus (1997). Stress is considered a relational concept; it is not characterized by a specific external stimulus or event, nor by rigid physiological, behavioral, or emotional responses. Instead, it emphasizes the connection between the person and the environment (Lim et al., 2023). Coping can be described as a continuous process that includes behavioral and cognitive strategies for dealing with both internal and external challenges perceived as too much or beyond a person's capabilities. From this perspective, coping refers to the behavioral and mental strategies used to manage stress. This idea emphasizes that coping strategies are distinct from their outcomes, allowing their impact on adaptation to be assessed independently from a research perspective (Lazarus, 1996). From a research viewpoint, this concept highlights that coping efforts are considered separate from outcomes, allowing their effects on adaptation to be evaluated independently (Lazarus, 1996).

According to Richard Lazarus and Folkman's Transactional Model, as cited by Borbowski (2005), stress can be thought of as resulting from an imbalance between demands and resources or as occurring when pressure exceeds one's perceived ability to cope. Stress management was developed and premised on the idea that stress is not a direct response to a stressor but instead on one's resources and ability to manage and mediate the stress response, and that this is amenable to change. Therefore, to create an

effective stress management program, it is essential first to determine the key factors that enable individuals to regulate stress, and then design interventions that specifically address those factors. The model proposes that people can be taught to manage their stress and cope with their stressors. They may learn to change their perspective on the stressor, thereby gaining the ability and confidence to improve their lives and handle all types of stressors.

The Biopsychosocial Model of Stress by Cordon (1997) states that stress comprises three interrelated components: external factors, internal factors, and the connection between the two. The external component refers to the events or conditions in the environment that occur before a person becomes aware of feeling stressed and that can trigger a stress response. These stressors generally fall into four main areas: personal, social or family-related, work-related, and environmental. Such experience is known to contribute to both psychological strain and physical health problems. Landow (2006) also points out that the loss of a loved one, or bereavement, is one of the most challenging stressors and has offered early evidence showing a connection between stress and immune system functioning.

This study's primary theoretical foundation is Lazarus's (1997) Transactional Theory of Stress and Coping, which emphasizes the dynamic interaction between people and their surroundings in reaction to stress. Teachers may not always be able to meet all of the demands placed on them by their institutions, classrooms, and personal lives. Accordingly, the theory offers a framework for comprehending how teachers respond to stressful circumstances and the coping strategies they use. Teachers' reactions and general

well-being are directly affected by their capacity to assess stress, whether it is perceived as a challenge or a threat. Therefore, this study examines how teachers perceive and react to stress in both their personal and professional environments using Transactional Theory.

On the other hand, the Biopsychosocial Model of Stress by Ingrid Cordon (1997) further strengthens the study by suggesting that stress among teachers does not arise from a single source but instead results from the interaction of biological, psychological, and social factors. Teaching is a profession that demands mental, emotional, and physical endurance. The theory of Ingrid Cordon helps us understand why teachers experience stress differently and highlights the need to address it holistically, considering their physical health, emotional state, and social support.

1.4 Schematic Diagram

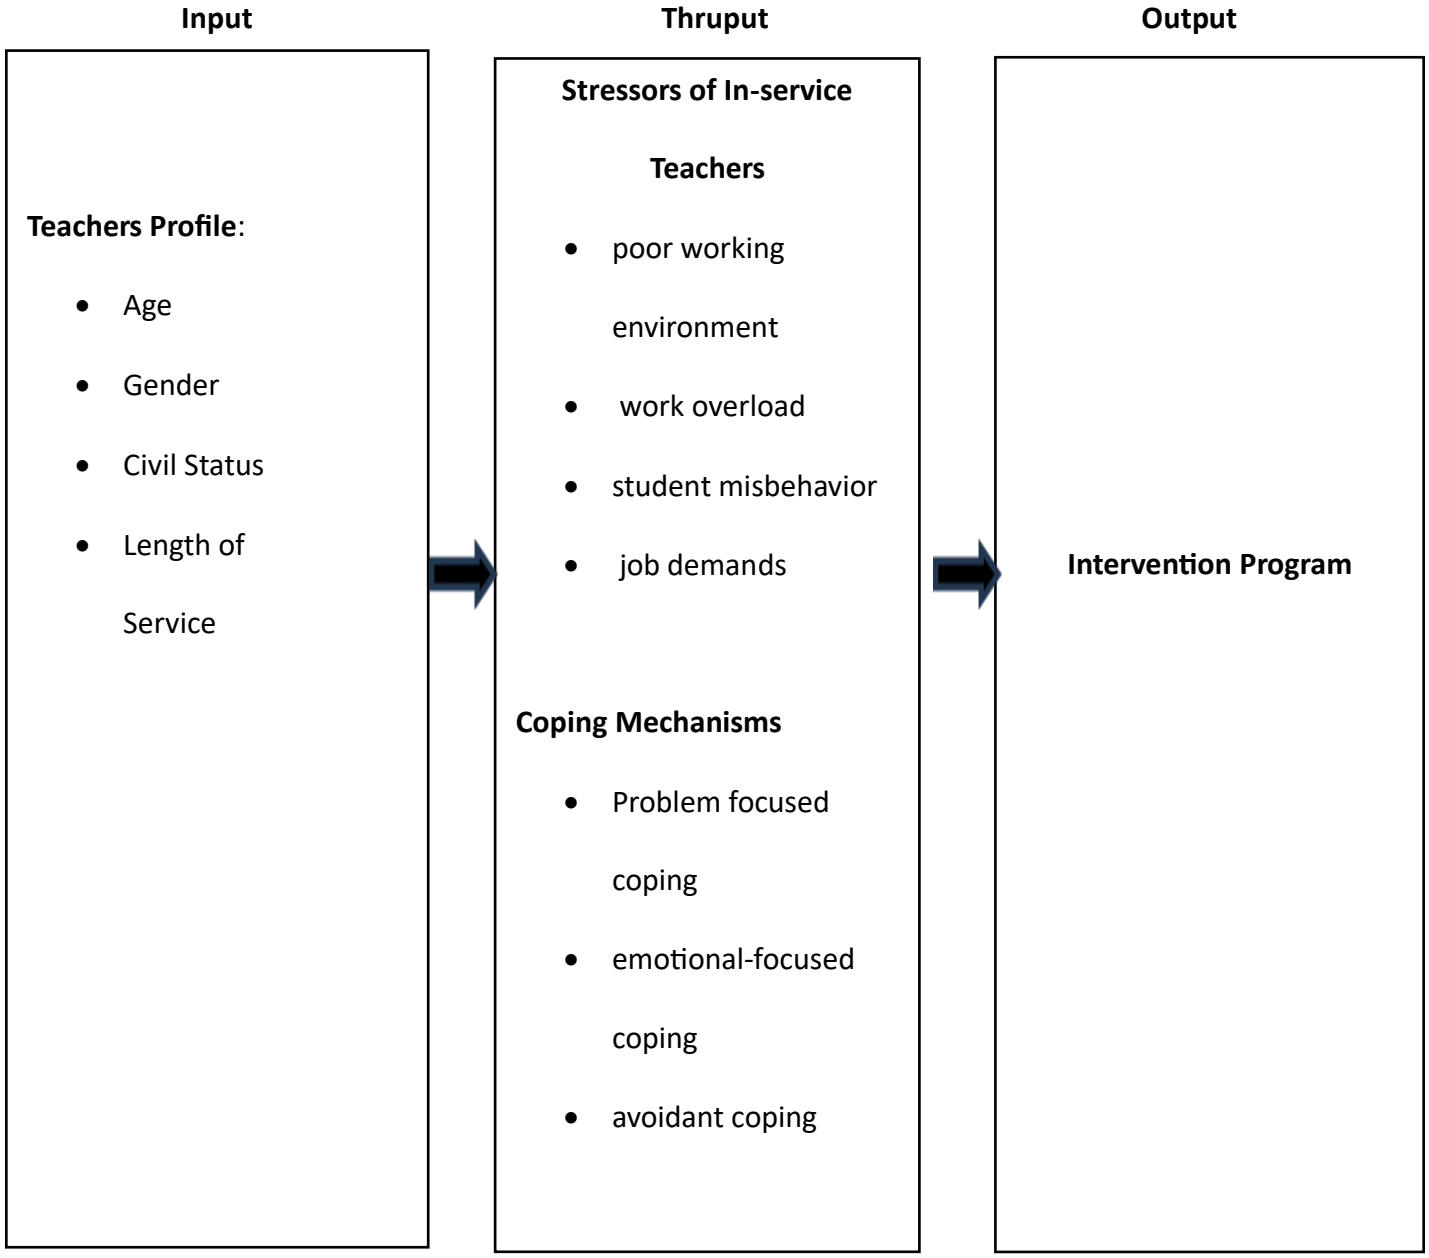

Figure 1. The figure shows the interplay of the variables of the study.

1.5 Statement of the Problem

The purpose of the study is to determine the stressors experienced by the Central Elementary Teachers at Nasipit, Agusan del Norte, and their coping strategies, which serve as the basis for the development of an intervention program to address the identified stressors.

Specifically, this study seeks to answer the following questions.

1. What is the profile of the participant in terms of:

    1.1 age;

    1.2 gender;

    1.3 civil status; and

    1.4 length of service?

2. What is the level of stress experienced by the Public Central School Teachers of Nasipit, Agusan del Norte in terms of:

    2.1. poor working environment;

    2.2. work overload;

    2.3. student misbehavior; and

    2.4. job demands?

3. What is the level of coping mechanism of the public central school teachers of Nasipit, Agusan del Norte in terms of:

    3.1. problem-focused coping;

    3.2. emotion-focused coping; and

    3.3. avoidant coping?

4. Is there significant relationship in the stress levels experienced by the Public Central School Teachers at Nasipit, Agusan del Norte with their profile?
5. Is there significant relationship in the stress levels experienced by the Public Central School Teachers at Nasipit, Agusan del Norte and their coping mechanism?
6. What coping mechanisms do the respondents prefer to use in response to the stress they experienced?
7. Based on the findings of the study, what intervention program may be develop?

1.6 Hypothesis of the Study

The following hypothesis guided by the study and tested at a 0.05 level of significance.

HO1: There is no significant relationship in the stress levels experienced by the Public Central School Teachers at Nasipit, Agusan del Norte with their profile.

HO2: There is no significant relationship in the stress levels experienced by the Public Central School Teachers at Nasipit, Agusan del Norte and their coping mechanism.

HO3: None of the coping mechanisms do the respondents prefer to use in response to the stress they experienced.

Scope and Limitation of the Study

This study will be conducted in three central schools in Nasipit, Agusan del Norte, namely; School A , forty-eight (48) teachers, School B including the SPED Center, thirty-seven (37) teachers, and School C twenty-one (21) teachers. Collectively, these schools have a total of one hundred six (106) teachers.

The study is limited to central schools in Nasipit, Agusan del Norte. These schools is chosen because they are the main public elementary schools in the municipality and have greater numbers of pupils and teachers. Furthermore, central schools have more established administrative systems and resources than smaller ones, making them ideal for collecting representative data and accurate information in line with the objectives of the study.

This study also examines the primary sources of stress experienced by the central school teachers in Nasipit, Agusan del Norte, including a poor working environment, work overload, student misbehavior, and job demands. It also examines the coping mechanisms respondents employ, including problem-focused and avoidance coping.

1.7 Definition of Terms

Age. This indicates the number of years each respondent has lived. This information will help identify if age will affect the level of stress respondents will feel and the coping mechanisms they will use. Respondents will be grouped by age ranges, for example, 20 to 29, 30 to 39, 40 to 49, and 50 and up.

Avoidance Coping. This implies the point at which respondents will try to escape or avoid stressful situations rather than face them. In this study, these will include procrastinating,

engaging in activities unrelated to work, avoiding responsibilities, and mentally checking out from stressful experiences. The survey will examine how often respondents will use these avoidance mechanisms to manage stress.

Civil Status. This pertains to respondents' marital status: single, married, widowed, or separated. This will be used to determine if marital status will affect their stress levels and coping mechanisms.

Coping Mechanism. This pertains to how respondents will handle stress. In this study, coping mechanisms will be divided into three types: problem-focused coping, which will involve dealing directly with the source of stress; emotion-focused coping, which will involve managing feelings related to stress; and avoidance coping, which will involve stepping back from the source of stress. The study will use a standardized questionnaire, the Carver Brief COPE Inventory, to measure these coping mechanisms.

Emotion-Focused Coping. This refers to managing emotional reactions to stress instead of trying to change the situation itself. This study will include self-reflection, relaxation, prayer or spiritual activities, seeking support from peers, and using positive self-talk. The survey will measure how often respondents will use these mechanisms when they will feel stressed.

Intervention Program. This refers to the set of planned actions and activities that will be designed from the study's findings to help lower teachers' stress and strengthen their coping. The program will teach stress management, offer peer support sessions, and aim to improve teachers' well-being and resilience at work.

Job Demands. This refers to the range and volume of tasks and responsibilities respondents will handle, including teaching, administrative work, and extracurricular activities. It will be measured using questionnaire items that will assess the extent to which respondents will perceive their workload as demanding or excessive.

Length of Service. This indicates how long respondents will have been in the teaching profession. This will help determine whether their stress levels and coping strategies will be affected by their teaching experience. The years of service of the respondents will be categorized as follows: 1–5, 6–10, 11–15, and 16+.

Poor Working Environment. This is defined as physical or organizational problems at work that will make teachers feel uncomfortable, less motivated, or less effective. The study will examine problems such as inadequate classroom facilities, insufficient teaching materials, crowded classrooms, noise, poor air quality, and limited administrative support. Respondents will share how much these issues will add to their stress.

Problem-Focused Coping. This refers to taking steps to address the sources of stress that will affect work performance. In this study, these mechanisms will include planning, finding solutions, managing time well, asking colleagues for help, and taking action to reduce stress from work tasks. The questionnaire will ask how often respondents will use these mechanisms when they will feel stressed.

Sex. This refers to whether the respondents will be male or female. This will help determine whether sex will influence the amount of stress respondents will experience and the coping mechanisms they will use.

Student Misbehavior. This refers to actions that will disrupt teaching or break classroom rules. In this study, examples will include not paying attention, ignoring instructions, talking back, skipping class, and lacking motivation. Respondents will share how often these behaviors will happen and how they will affect their stress and classroom management.

Stressors. This pertains to the internal and external factors that will make respondents feel frustrated, anxious, tense, angry, or depressed. In this study, stressors will include job pressure, job demands, human relations, the physical environment, and technological demands. The level of stress will be measured using a validated questionnaire on stress-related factors.

Work Overload. This refers to teachers having more work than they can finish during normal hours. This study will involve large teaching loads, extensive paperwork, additional tasks, and tight deadlines. The survey will examine how this overload will contribute to teachers' stress and affect their coping.

CHAPTER 2

RESEARCH METHODOLOGY

This chapter includes the research design used in the conduct of this study, followed by the research materials and methods, research environment, population and sample, data analysis plan, and ethical standards.

2.1 Research Design

This study will employ a descriptive-correlational research design. This study is descriptive because it will examine the level of stress teachers experience and the coping strategies they often use. It is correlational because it seeks to examine the relationships among stressors such as poor working environment, work overload, student misbehavior, job demands, human relations, and coping mechanisms, including problem-focused, emotion-focused, and avoidant coping.

Moreover, the study considers demographic variables age, gender, civil status, and length of service to determine how these factors may influence both the levels of stressors and the coping mechanisms used by the respondents.

2.2 Research Locale

This study will be conducted in the municipality of Nasipit, province of Agusan del Norte, specifically in three (3) Public Central Elementary Schools within the area, namely; School A, which is located at Barangay 4, Nasipit Agusan del Norte with the (Lat. 8.9859° N, Long. 125.3427° E), School B, in Purok Magkuno, Talisay, Nasipit, Agusan del Norte (Lat. 8.9817°, Long. 125.3397° E), and School C, in D-2 Kinabjangan, Nasipit Agusan del Norte

with the (Lat. 8.9746° N, Long. 125.36006° E). These schools are selected as the research locale because they serve as the primary public elementary centers in the municipality, accommodating many learners in their respective barangays. These public school institutions in the area are suitable settings for studying teachers' stressors and coping mechanisms. Moreover, teachers in these schools handle large class populations, which can lead to work-related stressors. Selecting these institutions ensures they will provide the study with meaningful insights to improve teacher well-being and school support in the community.

2.3 Research Environment, Population and Sample

The study's respondents will be determined using a purposive sampling technique, and there will be teachers selected from the three public central schools in Nasipit, Agusan del Norte.

The study will employ purposive sampling, as the respondents will be intentionally selected based on their relevance to the research aims. Teachers from the three public central schools in Nasipit, Agusan del Norte will be chosen by the researchers, as they have direct experience with the stressors and coping mechanisms that the study intends to examine. This approach will ensure that the respondents are informed and able to provide meaningful insights related to the study's focus.

This study has a total of one hundred six (106) respondents, where , forty-eight (48) teachers from School A, thirty-seven (37) teachers from School B, and twenty-one

(21) teachers are from School C. These numbers will represent the teachers who will participate in the study, ensuring that the results will reflect their experiences.

Table 1. The Distribution of Respondents of the Study

	Male		Female		Total	
School	**F**	**%**	**F**	**%**	**F**	**%**
School A	7	46.67	41	37.61	48	43.40
School B	3	20.00	34	14.68	37	34.91
School C	5	33.33	16	31.19	21	19.81
Total	**15**	**13.33**	**91**	**83.49**	**106**	**100**

Research Instruments

The main research instrument used in this study is a researcher-made questionnaire designed to gather accurate and sufficient data about the stressors faced by public central elementary school teachers. The questionnaire was developed using validated tools, established literature, and relevant theories on teacher stress to ensure it is valid, aligned with the topic, and reliable.

The questionnaire consists of four (4) major parts, with each part representing a specific category of teacher stressors identified in the review of literature: (1) Poor Working Environment, (2) Work Overload, (3) Student Misbehavior, and (4) Job Demands. Each part contains six (6) items, for a total of twenty-four (24). The respondents will answer each item using a 5-point Likert scale: 1 – Never, 2 – Rarely, 3 – Sometimes, 4 – Often, and 5 – Always.

Part I: Poor Working Environment (6 items). This section assesses teachers' perceptions of the school environment, with particular focus on leadership relations, communication, trust, and workplace physical conditions. Items were primarily adapted from Dr. Abigail M. Cabaguing's validated teacher stress questionnaire (2021). Sample items describe issues such as a lack of administrative support, poor communication, distrust in leadership, and uncomfortable or unpleasant working conditions.

Part II: Work Overload (6 items). This part measures the extent to which teachers experience excessive workload. Items include concerns related to lesson preparation, administrative paperwork, ancillary functions, large class sizes, and extended working hours. Several statements were adapted from Cabaguing (2021), while other workload-related items were based on the findings of Bongco and Ancho (2019) regarding factors contributing to the growing administrative and instructional burden on teachers.

Part III: Student Misbehavior (6 items). This section looks at how classroom discipline and student behavior affect teachers' stress. Two questions were adapted from Cabaguing (2021) and focus on issues such as students' lack of interest and challenges with discipline. Other items come from well-known and validated tools, including: Student Misbehavior Scale (Sun & Shek, 2012). Teacher Stress Inventory (Fimian, 1984). Teacher Stress Framework (Skaalvik & Skaalvik, 2017)

Part IV: Job Demands (6 items). The last section examines job pressures that require ongoing effort and quick task completion. The questions were adapted from well-known models of occupational stress, including: Job Demand Scale (Karasek, 1979), Job Demands–Resources (JD-R) Model (Bakker & Demerouti, 2007), Teacher Work Pressure

Items (Skaalvik & Skaalvik, 2017), Emotional Exhaustion Subscale (Maslach & Jackson, 1981).

The researchers adapted the Brief COPE, a 24-item questionnaire by Carver (1997), to assess how teachers cope with stress. The Brief COPE measures both helpful and unhelpful ways people respond to stress. It is widely used in health, psychology, and education to study how people handle stress from illness, work, trauma, and daily life. For the purpose of this study, the instrument was organized into three (3) main parts, each representing a broader dimension of coping strategies.

Although the original Brief COPE contains 14 two-item subscales, the researchers adapted 12 subscales to the study's needs, resulting in 24 items. These subscales were grouped into the following overarching categories: problem-focused coping, emotion-focused coping, and avoidant coping. Each subscale contains two (2) items, contributing to the total of 24 items in the adapted instrument.

Part I. Problem-Focused Coping. This section includes strategies for managing or solving the cause of stress. This category includes subscales such as Active Coping, Planning, and Use of Instrumental Support, which offer practical ways to deal with stress.

Part II. Emotion-Focused Coping. This section covers ways to manage emotional reactions to stress. It includes subscales such as Positive Reframing, Acceptance, Humor, Religion, and Use of Emotional Support, which help people manage their feelings during stressful times.

Part III. Avoidant Coping. This section includes strategies that help people distance themselves from stress. This group covers Self-Distraction, Venting, Denial, and Behavioral

Disengagement. The last part of this section examines unhelpful habits, especially those that indicate emotional withdrawal or unproductive responses to stress. Studying these avoidant strategies is important because they can lead to more emotional distress or burnout for teachers.

All items included in the instrument were adapted directly from Carver's (1997) Brief COPE, a validated and widely utilized coping inventory in behavioral and health research.

2.4 Data Gathering Procedure

Before the actual data collection, the researchers will ensure that all ethical and administrative requirements are fulfilled. The researchers will first obtain permission from the Dean, VPAAR, and Program Head of Saint Michael College of Caraga to formally conduct the study. After securing approval, the researchers will proceed with the data-gathering process and will follow the established research protocols to maintain the validity and reliability of the study. The researchers will also request permission from the principals of the selected Central Schools in Nasipit, Agusan del Norte, namely: School A, School B, and School C. The researchers will submit formal letters clearly stating the purpose of their study entitled "Stressors and Coping Mechanisms of In-Service Teachers: Basis for Intervention Program." Once the respondents complete the questionnaires, the researchers will retrieve them immediately. The gathered data will then be organized, collated, and tabulated according to the research problems identified in the study.

Letter of Approval. The researchers will secure signed approval letters from the Dean, VPAAR, and Program Head of Saint Michael College of Caraga, as well as from the school principals of the identified schools. These approval letters will allow them to distribute the research item to the teachers. The letters will serve as authorization to conduct the study and gather the necessary data from the respondents.

Informed Consent. Before conducting the study, the researchers will inform the respondents about the nature and purpose of the study, how the data will be collected, and their right to participate voluntarily. They will be asked to sign an informed consent form before answering the questionnaire.

Distribution of the Questionnaire. The researchers will personally visit each selected school and distribute printed copies of the survey questionnaire to the teachers. They will coordinate with the principal or assigned school contact person to schedule the distribution and retrieval dates. Respondents will be given enough time to answer the questionnaire during their free period or at a convenient time agreed upon by the school administration.

Gathering of Data. After the collection period, the researchers will check, tally, and organize the completed questionnaires. The gathered data will then be presented, analyzed, and interpreted using appropriate statistical tools to answer the research questions and serve as the basis for the proposed intervention program.

Data Analysis Plan and Procedure

The collected data will be organized, analyzed, and interpreted using appropriate statistical methods suited for a quantitative descriptive–correlational design.

Frequency and Percentage. To describe the profile of the respondents in terms of age, gender, civil status, and length of service.

Mean. To determine the level of stress experienced by the Central Schools Teachers and the coping mechanisms they use.

Correlational Analysis. To find out if there is a significant relationship between the stress levels and coping mechanisms of the respondents

Regression Analysis. To determine how coping mechanisms predict or influence teachers' stress levels.

The results will be interpreted using the Likert scale and analyzed both descriptively and inferentially to answer the research questions and guide the development of the proposed intervention program.

2.5 Research Ethical Standards

Ethical Consideration

A. Intellectual Property Rights (IPR)

The study will respect intellectual property rights by ensuring that all research outputs, including instruments and analytical frameworks used, will be protected under Philippine copyright law. All third-party sources and secondary data in this research will be

properly cited. Since no new logos, symbols, or brands will be created, there will be no need for trademark registration.

B. Informed Consent

Before collecting any data, participants will receive an informed consent form that will explain the purpose of the study, what will happen during the research, any possible risks or benefits, and how their information will be kept confidential. Participants will have time to consider their decision and will be welcome to ask questions before choosing whether to join. Participation will be entirely their choice, and they will be free to say no or leave the study at any time without consequences.

C. Data Privacy and Confidentiality

The researchers will keep all information from surveys completely confidential. The researchers will collect personal details, such as names and demographic information, only if participants give their consent. To protect privacy, all responses will be anonymized, and no identifying details will appear in the research report. Anonymized data will be used or shared for academic purposes only, with respondents consent and in compliance with ethical and legal standards. The researchers will commit to reporting results truthfully, without bias, and will use all data solely for academic purposes.

D. Voluntary Participation

Informed consent stating that participation is voluntary will be discussed. If any discomfort arises, participants will be allowed to withdraw from the study without consequences.

E. Minimization of Harm

Participants in this study may experience minimal risks, such as feeling uncomfortable, stressed, or self-conscious while answering the survey questions. If any participant feels distressed or uneasy during data collection, the researchers will immediately stop the survey and provide appropriate support to address their concerns. The researchers will ensure that participants are aware that they may withdraw from the study at any time without any negative consequences. All measures will be taken to minimize emotional or psychological discomfort, and participants will be encouraged to seek further support if needed.

F. Beneficence

This research will aim to help understand the challenges teachers face at Central School in Nasipit, Agusan del Norte, and how these challenges affect their work and well-being. By finding out what causes the most stress and which coping methods work best, the study will guide future support programs and wellness efforts for teachers. These steps will help make the school a healthier, more positive place where teachers will feel appreciated and better prepared to meet daily challenges. The study will also aim to raise awareness among school leaders, students, parents, and the community about what teachers go through, encouraging empathy and stronger cooperation between the school and the community.

Participants may not notice benefits right away, but their involvement will help the researchers learn important lessons that can improve teacher support programs and education policies. If participants request, they will receive a summary of the research

findings to reflect on the results and use the information for their own growth or to support their school community.

G. Justice and Fair Participant Selection

The study will ensure that participant selection is inclusive and unbiased by allowing diverse groups equal opportunities to participate. Participants will be selected through simple random sampling, ensuring that every teacher has an equal chance of being part of the study. The research will avoid any exclusion criteria unless they are relevant to the objectives of the study. Throughout the process, all participants will receive equal quality of treatment before, during, and after the study.

A total of one hundred six (106) respondents will be selected for this study. This number will be determined based on the total population of teachers from the three participating schools. Specifically, **forty-eight (48)** teachers will be from **School A, thirty-seven (37)** teachers will be from **School B, and twenty-one (21)** teachers will be from **School C.**. The selection will ensure fairness and representation across schools while keeping the sample size manageable for accurate data collection and analysis.

H. Data Integrity and Accuracy

To uphold data accuracy and validity, multiple integrity measures will be employed. The researchers will double-check responses to prevent input errors and any inconsistencies in the raw data. The modified test questionnaire will be reviewed by research advisers to ensure it will appropriately measure the study's variables.

I. Transparency in Reporting

In reporting the findings, all data will be anonymized to guarantee that individual responses cannot be linked back to participants, further safeguarding their confidentiality. The researchers will commit to presenting the data truthfully and accurately while maintaining the confidentiality of all participants. The results will be used solely for the intended research purposes. Moreover, the researchers will acknowledge the copyrighted materials through proper citation in the research paper.

J. Use of Patented or Copyrighted Materials

The researchers will use standardized instruments, such as the freely accessible stress-related scale available in the college library, which the instructor advised them to use as a guide. Meanwhile, the researchers will also use the Brief COPE, as instructed by the author, which is free to use. They will provide proper citation to uphold the author's intellectual property rights.

K. Ethical Considerations for Animal and Human Trials

The researchers will use an informed consent form detailing the risks and benefits participants may obtain from participating in the study. They will also give participants time to ask clarifying questions to ensure complete agreement before finally taking part in the study.

L. Responsible Use of AI and Related Technologies

The study will use AI tools and digital technologies to support different parts of the research process. Grammarly will help maintain proper grammar and clarity in the report. ChatGPT will be used to find ideas that expand the literature review. To use these

technologies responsibly, the researchers will review all AI-generated content and ensure it does not introduce bias or errors. They will also inform participants about the use of these tools to keep the research process transparent and trustworthy.

M. Ethical Approval

Ethical approval for the research will be granted by the institutional review board of Saint Michael College of Caraga, verifying compliance with all applicable guidelines regarding participant protection, data privacy, and intellectual property rights.

Dear Ms. Senanin,

Greetings of Peace!

In partial fulfillment of the requirements for the degree, Bachelor of Elementary Education (BEED) at Saint Michael College of Caraga, we the third-year students, are currently preparing a thesis proposal entitled: **"Stressors and Coping Mechanism of Teachers: Basis for Intervention Program"**

In connection with this, we respectfully seek your permission to conduct our study at your esteemed institution. As part of the initial stage of our research, we also request a copy of the list of teachers for the school year 2025–2026. This information will serve as a vital reference in identifying repondents for our study.

We assure you that the list and any subsequent data gathered will be treated with strict confidentiality and will be used solely for academic purposes. No personal or sensitive information will be disclosed.

Your approval and support in this academic endeavor will greatly aid us in completing our research study.

We look forward to your favorable response to this request. Thank you very much for your consideration and assistance.

Respectfully yours,

ROSE ANN Q. OGANG
Research Leader

To: ccarver@miami.edu

Dear Dr. Carver,

Greetings!

We are 3rd Year Bachelor of Elementary Education (BEED) students from Saint Michael College of Caraga, currently conducting a research study entitled "STRESSORS AND COPING MECHANISM OF TEACHERS: BASIS FOR INTERVENTION PROGRAM" as part of the requirements for our degree.

In line with this, we have come across your study on the Brief COPE. We found your research instrument highly relevant and appropriate for our study. With respect for your scholarly work, we humbly request your permission to adapt and revise the Brief COPE for academic and research purposes only.

We assure you that the instrument will be used solely for non-commercial and academic purposes, and proper acknowledgment and citation of your work will be strictly observed in our manuscript and any related presentations.

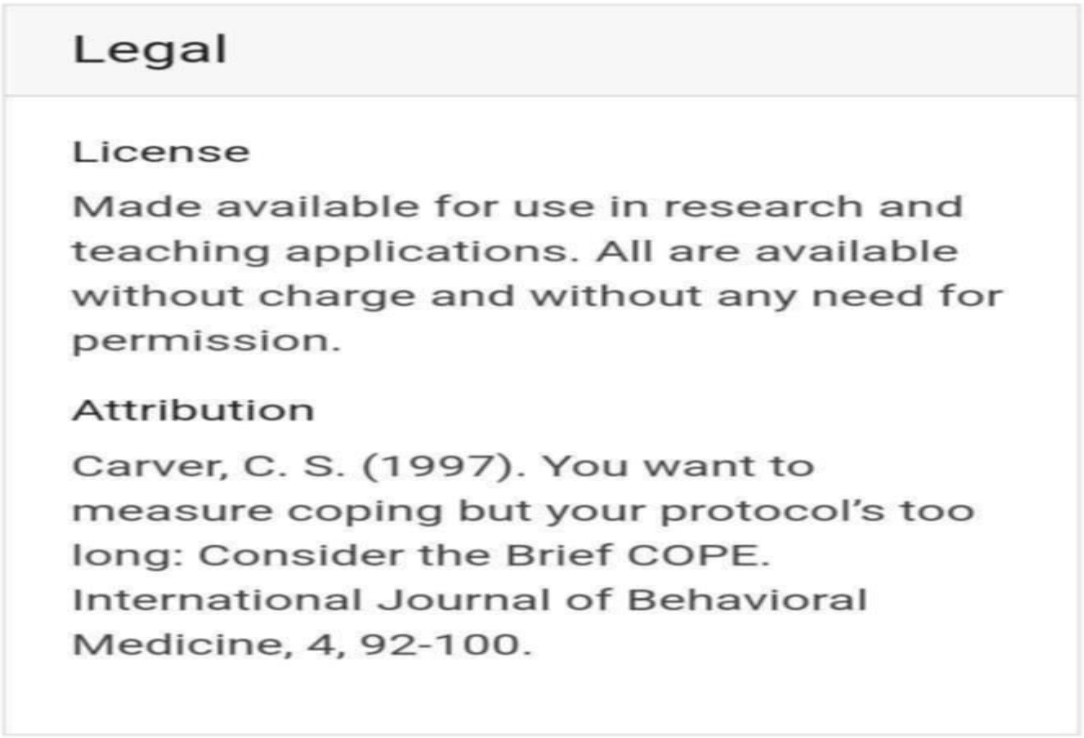

We would be deeply grateful for your approval and support. Thank you very much for considering our request. May you continue to be blessed in your academic and professional endeavors.

Respectfully yours,

ROSE ANN Q. OGANG
Research Leader

Carver, C. S. (1997). You want to measure coping but your protocol's too long: Consider the Brief COPE. International Journal of Behavioral Medicine, 4, 92-100.

APPENDIX B

B-1. Instrument with Informed Consent

SURVEY QUESTIONNAIRE

PART I – RESPONDENTS' PROFILE

Directions: Please put a check (✓) or write your answer in the space provided.

1. Sex
☐ Male ☐ Female

2. Age:
☐ 20–25 years old
☐ 26–30 years old
☐ 31–35 years old
☐ 36–40 years old
☐ 41–45 years old
☐ 46 years old and above

3. Civil Status:
☐ Single
☐ Married
☐ Widowed
☐ Separated
☐ Others: _____

4. Length of Service:
☐ 1–3 years
☐ 4–6 years
☐ 7–9 years
☐ 10–12 years
☐ 13 years and above

PART II. STRESSORS IDENTIFICATION (researchers made)

Instruction:

Listed below are various kinds of stressors that may arise in your work as teachers. Indicate the frequency of the following problems, concerns, and obstacles to your duties in school by placing a check mark (✓) inside the box corresponding to how often you experience them.

Scale:

1 – NEVER: not experienced at all in your daily work
2 – SELDOM: happens once a month
3 – SOMETIMES: happens once a week
4 – USUALLY: happens several times a week
5 – ALWAYS: happens daily

A. Poor Working Environment

Indicators	1	2	3	4	5
I feel frustrated because I feel I know better than my immediate head.					
I feel like my school head has personal resentment towards me.					
My relationship with my supervisor lacks trust and respect.					
I feel bad that school administrators/head do not inform teachers about important matters.					
I feel disappointed that I cannot seek help and advice from my immediate head.					
Learning environment is not conducive because of unpleasant odors or school conditions.					

B. Work Overload

Indicators	1	2	3	4	5
I have too many lesson preparations beyond teaching hours.					
I have excessive administrative paperwork.					
I don't have enough time to relax after school due to work.					
I am assigned many ancillary functions (non-teaching tasks).					
I work beyond official hours to finish responsibilities.					
The number of students/classes I handle increases my workload.					

C. Student Misbehavior

Indicators	1	2	3	4	5
I feel disappointed when pupils show no interest despite my effort.					
I find it difficult to discipline my students.					
Students show disrespectful behavior (e.g., answering back, ignoring instructions).					
I feel stressed when students disrupt lessons by making noise or distracting others.					
I struggle to manage students who frequently argue or fight.					
Some students talk without permission and interrupt the class.					

D. Job Demands

Indicators	1	2	3	4	5
My job requires me to work very fast to meet deadlines.					
I often feel that there is too much work to finish in a limited time.					
I am required to juggle multiple tasks at the same time.					
I experience mental fatigue due to the demanding nature of my job.					
There are times when unexpected tasks or sudden deadlines add pressure to my work.					
I find it difficult to finish personal tasks because of work responsibilities.					

PART III – Coping Mechanism (Brief COPE Adapted Instrument)

Directions: Please read each statement carefully and put a check (✓) in the box that best represents how often you have been using each coping strategy.

Scale:

1 – I haven't been doing this at all
2 – I've been doing this a little bit
3 – I've been doing this moderately
4 – I've been doing this a lot

PROBLEM-FOCUSED COPING

Statement	1	2	3	4
I've been concentrating my efforts on doing something about the situation I'm in.				
I've been taking action to try to make the situation better.				
I've been getting help and advice from others.				
I've been trying to come up with a strategy about what to do.				
I've been looking for something good in what is happening.				
I've been trying to see it in a different light, to make it seem more positive.				
I've been trying to get advice or help from other people about what to do.				
I've been thinking hard about what steps to take.				

EMOTION-FOCUSED COPING

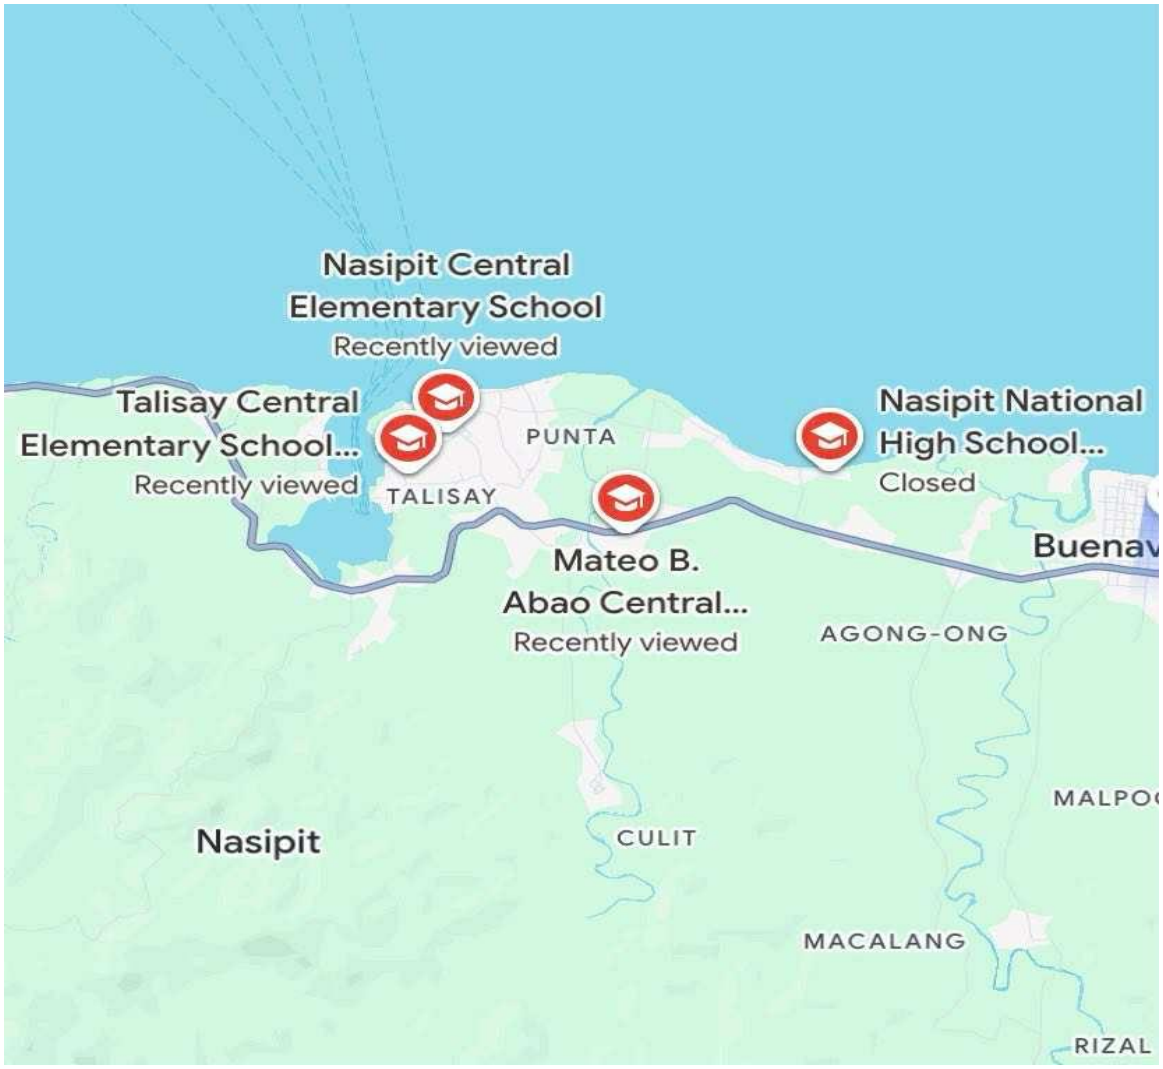

Statement	1	2	3	4
I've been getting emotional support from others.				
I've been saying things to let my unpleasant feelings escape.				
I've been criticizing myself.				
I've been getting comfort and understanding from someone.				
I've been making jokes about it.				
I've been accepting the reality of the fact that it has happened.				
I've been expressing my negative feelings.				
I've been praying or meditating.				
I've been trying to find comfort in religion or spiritual beliefs.				
I've been learning to live with it.				
I've been blaming myself for things that happened.				
I've been making fun of the situation.				

AVOIDANT COPING

Statement	1	2	3	4
I've been turning to work on other activities to take my mind of things.				
I've been saying to myself "this isn't real"				
I've been using alcohol or other drugs to make myself feel better.				
I've been giving up trying to deal with it.				
I've been refusing to believe that it has happened.				
I've been using alcohol or other drugs to help me get through it.				
I've been giving attempt to cope.				
I've been doing somethings to think about it les, such as going to movies, watching TV, or shopping.
